Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Thank you for the opportunity to comment. Sincerely,

#37

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Thank you for the opportunity to comment. Sincerely,

JAN 07 2010

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

RECEIVED
DEC 29 2009
HABITAT PROGRAM

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Thank you for the opportunity to comment. Sincerely,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support many aspects of the plan and commend the Department for subjecting the plan to thorough scientific review.

If this plan is to provide for wolf recovery over the long term, it is critical that the following changes be made:

- Increase the number of established breeding pairs before a delisting is proposed or provide a stronger evaluation of the state's habitat connectivity to other regions and details on how connectivity will be improved over time. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

- Provide separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives.

- Eliminate the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Given the history of poaching in this state and the high potential for misuse, this provision could seriously hamper recovery efforts. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. - eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Thank you for the opportunity to comment. Sincerely,

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low especially since the plan relies on natural migration from areas outside the state for recovery.

RECEIVED
DEC 14 2009
HABITAT PROGRAM

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Thank you for the opportunity to comment. Sincerely,

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

RECEIVED
DEC 14 2009
HABITAT PROGRAM

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Thank you for the opportunity to comment. Sincerely,

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Thank you for the opportunity to comment. Sincerely,

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. - provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support many aspects of the plan and commend the Department for subjecting the plan to thorough scientific review.

If this plan is to provide for wolf recovery over the long term, it is critical that the following changes be made:

- Increase the number of established breeding pairs before a delisting is proposed or provide a stronger evaluation of the state's habitat connectivity to other regions and details on how connectivity will be improved over time. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

- Provide separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives.

- Eliminate the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Given the history of poaching in this state and the high potential for misuse, this provision could seriously hamper recovery efforts. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

- Support the translocation of wolves as a strategy to speeding recovery by establishing implementation mechanisms and providing a funding schedule in the plan.

Thank you for the opportunity to comment. Sincerely,

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support many aspects of the plan and commend the Department for subjecting the plan to thorough scientific review.

If this plan is to provide for wolf recovery over the long term, it is critical that the following changes be made:

- Increase the number of established breeding pairs before a delisting is proposed or provide a stronger evaluation of the state's habitat connectivity to other regions and details on how connectivity will be improved over time. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

- Provide separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives.

- Eliminate the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Given the history of poaching in this state and the high potential for misuse, this provision could seriously hamper recovery efforts. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Dear Washington Department of Fish and Wildlife,

Thank you for your proactive and collaborative approach to managing wolves and planning for their eventual recovery. I support alternative #3 in the Draft Environmental Impact Statement for the Wolf Conservation and Management Plan because it:

- provides separate population recovery objectives for the Pacific Coast where high quality wolf habitat and increased public support justify it having its own recovery objectives, and

- eliminates the "caught in the act" killing provision for livestock owners at the endangered and threatened phases of recovery. Investing in non-lethal deterrent methods and providing livestock owners with a fair compensation package are more effective approaches at the early stages of wolf recovery.

I also am requesting that you increase the overall number of established breeding pairs before a delisting is proposed. A significant number of scientific reviewers believe that the department's numbers for delisting were low, especially since the plan relies on natural migration from areas outside the state for recovery.

I also support the translocation of wolves as a strategy to speed recovery, and ask that the department establish implementation mechanisms and provide a funding schedule in the plan for translocation to the south Cascades and Pacific Coast regions.

Thank you for the opportunity to comment. Sincerely,
