Will genetically altering the fish cause them to be sterile as with the Triploid trout? I feel it's wrong to genetically alter anything, leave what God created alone. If you really want to increase the fish population get the nets off the mouths of the rivers. If necessary close the rivers to fishing for a substantial amount of time so the fish population can be reestablished. Of course that would mean no one would buy a fishing license for a few years, but then, it isn't really about money is it? It's about endangered species. You need to study other things that have been genetically altered and the outcome. Even though this takes time it will be time well spent. Thank you for your time. Bonnie Geschke
