## Part 6—Project Description

**6a.** Summarize the overall project. You can provide more detail in 6d. [\[help\]](#)

This site is owned by Tacoma Power and managed by the WDFW as wildlife mitigation lands. The beaver dam is impounding approximately 3 feet of water and the resulting inundation makes it impossible to conduct activities to meet management objectives. Permitting has already been obtained to breach a berm that is also identified as contributing to the problem. Breaching the beaver dam may eliminate the need to breach the berm which has a greater environmental impact through the removal of established vegetation and excavation. As per best management practices, the breaching will be done slowly in stages to prevent scouring and debris flows. The breaching will be conducted with a DNR labor crew and hand tools to allow better control of the drawdown. Work will be conducted only during the July 1 to September 30 work window to protect fish stocks. Staff will observe the site during water drawdown to prevent fish kill and to watch for redds. The finished project will further the overall objectives of restoring fish passage to the upper Siler Creek watershed, restoration of a diverse vegetation population and the suppression of the dominant reed canarygrass cover.

Start date: July 1, 2010

End date: September 30, 2012

See JARPA Attachment D

**6f.** Describe the purpose of the project and why you want or need to perform it. [\[help\]](#)

The southern berm of "Channel A", created from historic dredging activities, is creating a de facto dike that is acting to disrupt natural hydrology by impounding and maintaining artificially high water over most of the central portion of the area. It is necessary to partially dewater the area lying east and south of "Channel A" to restore the natural hydrology and a more diverse vegetation community. Removing portions of the berm has been permitted by local, state and federal agencies but will require excavation and vegetation removal. Removing the beaver dam may make the berm removal project unnecessary thereby creating fewer disturbances and less impact to the environment in the project location. The result of this project will be to change the hydroperiod from a permanently flooded basin inundated by reed canarygrass to a seasonally flooded site (consistent with historic conditions) that will both maintain its wetland function as well as provide for both a diverse plant community and optimal wildlife habitat. This project is part of a larger restoration plan to restore the site to more natural historic conditions and to provide a hydrologic regime that will protect water quality and provide optimal habitat for fish and wildlife resources. It is also surmised that flooding to neighboring properties most likely will be lessened.

**6g.** Fair market value of the project, including materials, labor, machine rentals, etc. [\[help\]](#)

\$1800.00

**6h.** Will any portion of the project receive federal funding? [\[help\]](#)

- If **yes**, list each agency providing funds.
