

Spawning habitat conditions:  None  Poor  Fair  Good  Excellent

Describe spawning habitat:

Rearing habitat conditions:  None  Poor  Fair  Good  Excellent

Describe pond and other rearing habitat: The initial 448 meters of this site is slough-like with sluggish moving water and a mud substrate. The wetted width ranges from 1.2 meters to 23 meters. The next 200 meters upstream of this point is in a ditch through a nursery and there are three culvert crossings in this section (EB5,EB6,EB7). The upper most section of this site is a swampy area upstream of the railroad grade as water gets impounded by the grade.

Describe inaccessible habitat:

Wetland type:  Bog  Marsh  Scrub-shrub  Forested

Describe:

Flooding potential:  Low  Medium  High

Describe: This site at the very least gets backwatered during flood events and the bench that it sits on may get over-topped during the major flood events.

#### FISH INFORMATION

Site entry condition:  Poor  Fair  Good

Describe: Fish access is fair when the flows are moderate as there is an exposed gravel bar that this site flows through and there is a small drop that fish need to negotiate. Fish access improves as flows increase.

Coho access and use: Juvenile  Unknown  None  Poor  Fair  Good  
Adult  Unknown  None  Poor  Fair  Good

Describe: There were juvenile coho observed in the site at the lower end.

Other species access and use:  Chum  Pink  Sockeye  Chinook  Trout

Describe: Trout use is very likely as well.

ENHANCEMENT OPPORTUNITIES: If the landowner is willing, improve fish passage on the three culvert crossings with the initial culvert being a tidegate. Also, some planting along the banks would be useful as well.

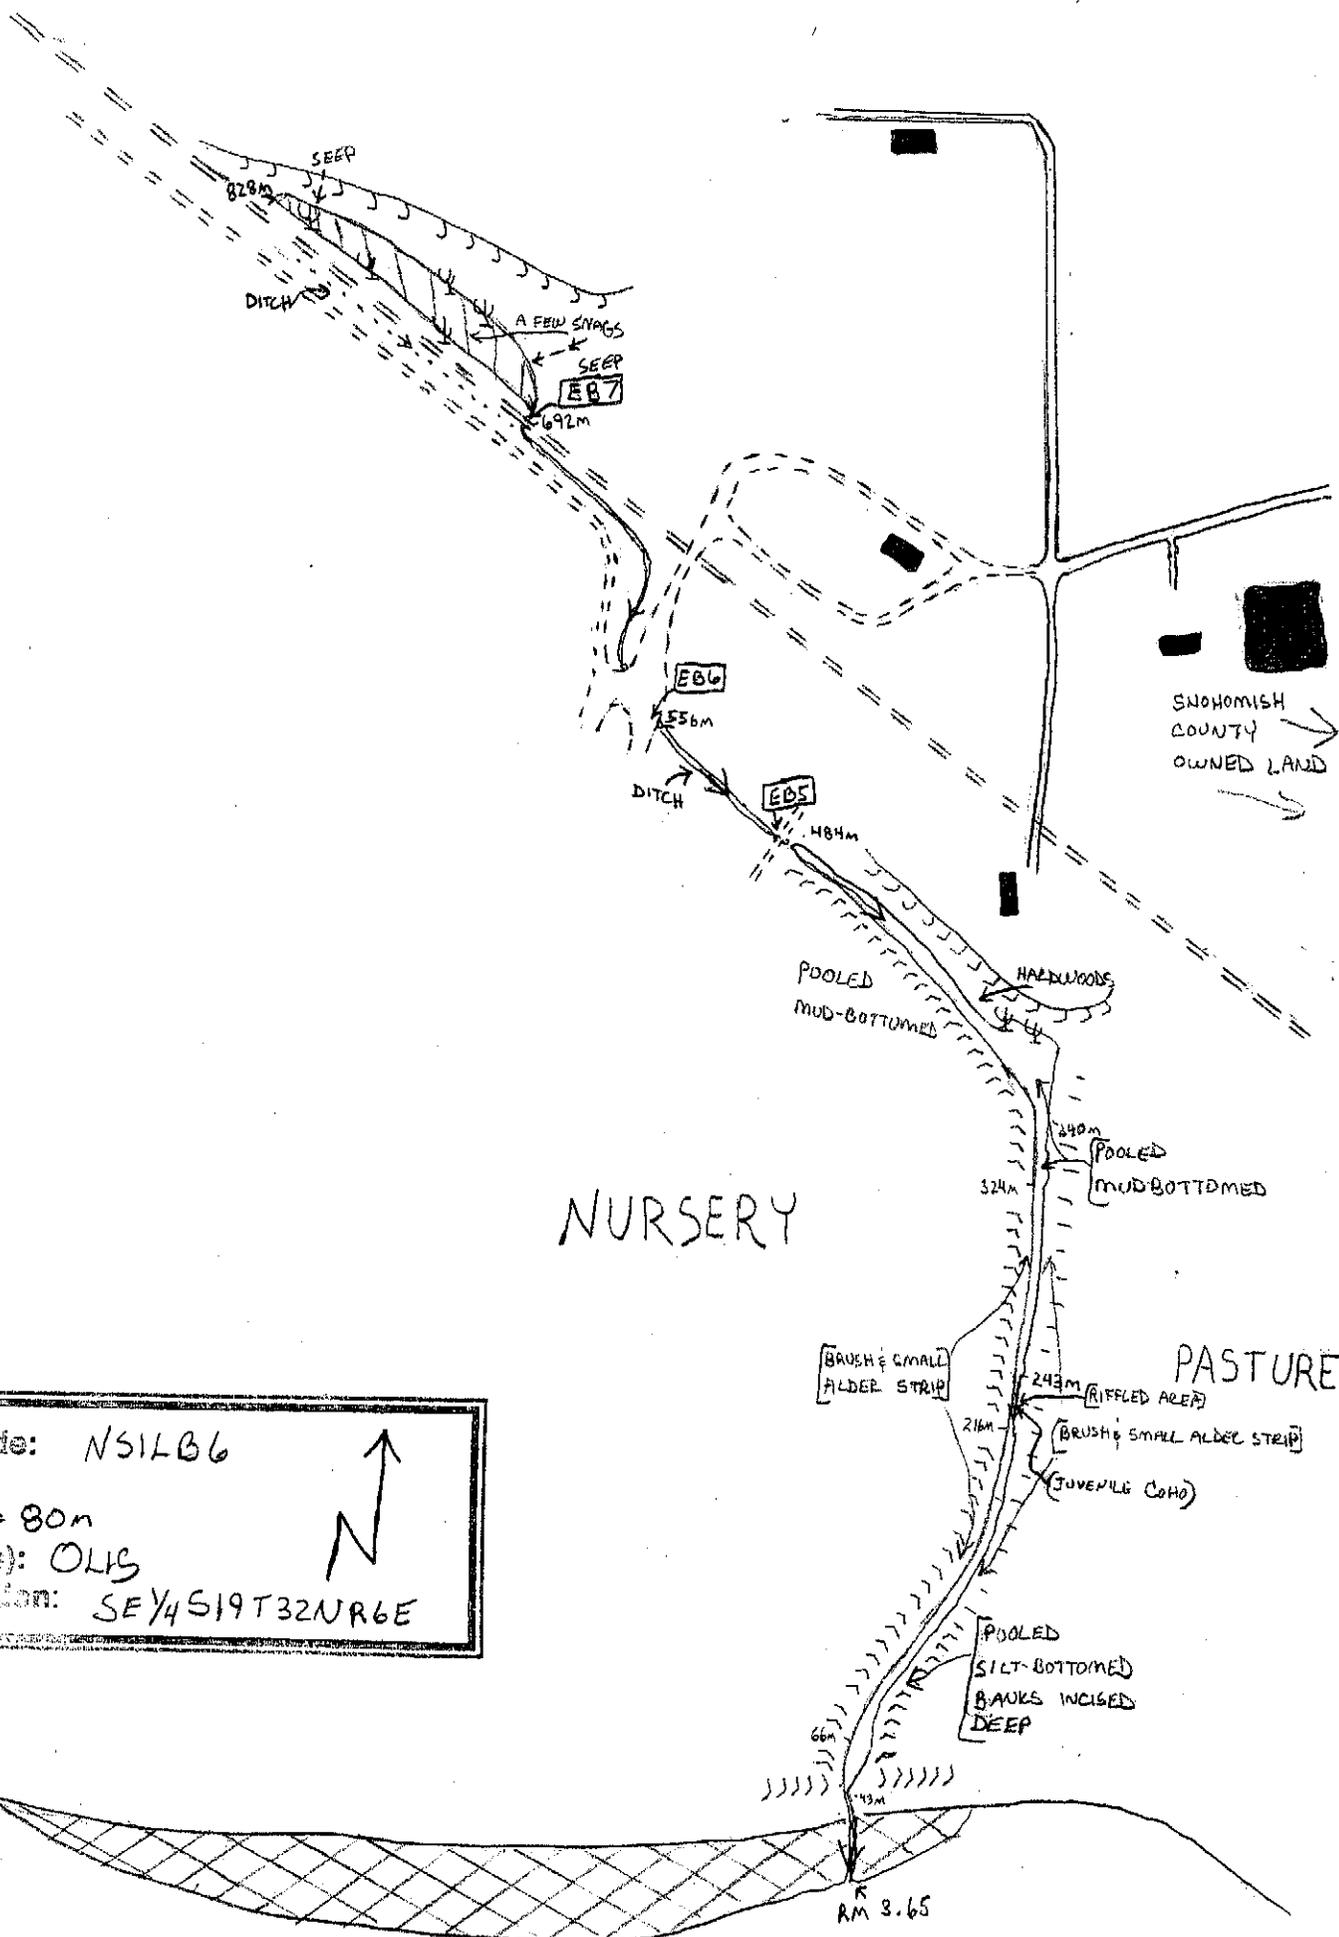

Project type:

Equipment access:

ADDITIONAL COMMENTS: The survey ended in the swampy area just upstream of the railroad grade.
