## **INTRODUCTION**

This report describes sturgeon and smelt populations in the mainstem Columbia River and includes a review of fisheries, current management plans and guidelines, and past management actions and strategies. This report is part of an annual series produced by the Joint Columbia River Management Staff of the Oregon Department of Fish & Wildlife (ODFW) and Washington Department of Fish & Wildlife (WDFW). Members of the *U.S. v Oregon* Technical Advisory Committee (TAC) have reviewed this report.

## **THE COMPACT**

The Columbia River Compact is charged by congressional and statutory authority to adopt seasons and rules for Columbia River commercial fisheries. In recent years, the Compact has consisted of delegates for the Oregon and Washington agency directors, acting on behalf of the Oregon Fish and Wildlife Commission (OFWC) and the Washington Fish and Wildlife Commission (WFWC). In addition, the Columbia River treaty tribes have authority to regulate treaty Indian fisheries.

When addressing commercial seasons for Columbia River fisheries, the Compact must consider the effect of the commercial fishery on escapement, treaty rights, and the impact on species listed under the Endangered Species Act (ESA). Working together under the Compact, the states have the responsibility to address the allocation of limited resources between recreational, commercial and treaty Indian fishers. This responsibility has become increasingly demanding in recent years. The states maintain a conservative management approach when considering Columbia River fisheries that will affect species listed under the ESA.

## **SEASONS CONSIDERED**

Based on previous OFWC and WFWC action, effective January 1, 2014 all recreational and non-Indian commercial fisheries in the Columbia River and tributaries downstream of Bonneville Dam (LCR) closed to the retention of white sturgeon. The Sturgeon Management Task Force (SMTF) is scheduled to meet early in 2015 to review results of the 2014 stock assessment in The Dalles Pool and to discuss management options for 2015, including harvest guidelines for 2015 Zone 6 white sturgeon fisheries.

As a result of the 2010 ESA listing of eulachon (Columbia River smelt) all eulachon-directed fisheries in the Columbia River closed as of January 2011. In 2014, the states worked closely with NMFS to conduct minor eulachon research fisheries to gather adult catch-per-unit-effort (CPUE) data for monitoring the status of the population.

## ENDANGERED SPECIES ACT (ESA)

### *Salmon and Steelhead*

Status reviews occurring since 1991 have resulted in the majority of Columbia Basin salmon and steelhead stocks being listed under the ESA as shown in the table below. The *U.S. v Oregon* TAC has prepared Biological Assessments (BAs) for combined fisheries based on relevant *U.S. v Oregon* management plans and agreements since 1992.

<i>Federally-listed Species Found in Columbia River Fishery Management Areas</i>			
Species – <i>ESU/DPS</i>	Current Designation	Listing Date	Effective Date
<u>Chinook</u>			
Snake River Fall	Threatened	April 22, 1992	May 22, 1992
Snake River Spring/Summer	Threatened	April 22, 1992	May 22, 1992
Upper Columbia Spring	Endangered	March 24, 1999	May 24, 1999
Upper Columbia Summer/Fall	Not warranted	--	--
Middle Columbia Spring	Not warranted	--	--
Lower Columbia River Spring/Fall	Threatened	March 24, 1999	May 24, 1999
Upper Willamette Spring	Threatened	March 24, 1999	May 24, 1999
Deschutes River Summer/Fall	Not warranted	--	--
<u>Steelhead</u>			
Snake River Basin	Threatened	August 18, 1997	October 17, 1997
Upper Columbia River <sup>1</sup>	Threatened	August 18, 1997	October 17, 1997
Lower Columbia River	Threatened	March 19, 1998	May 18, 1998
Middle Columbia River	Threatened	March 25, 1999	May 24, 1999
Southwest Washington	Not warranted	--	--
Upper Willamette	Threatened	March 25, 1999	May 24, 1999
<u>Sockeye</u>			
Snake River	Endangered	November 20, 1991	Dec. 20, 1991
Okanogan River	Not warranted	--	--
Lake Wenatchee	Not warranted	--	--
<u>Chum</u> – Columbia River	Threatened	March 25, 1999	May 24, 1999
<u>Coho</u> – Columbia River	Threatened	June 28, 2005	August 26, 2005
<u>Green Sturgeon</u> - Southern DPS	Threatened	April 7, 2006	July 7, 2006
<u>Eulachon</u> - Southern DPS	Threatened	March 18, 2010	May 17, 2010

<sup>1</sup> Status downgraded to threatened per U.S. District Court order in June 2009.

The current BA concerns Columbia River treaty Indian and non-Indian fisheries, as described in the “2008-2017 *U.S. v Oregon Management Agreement for upriver Chinook, sockeye, steelhead, coho, and white sturgeon*” (2008-2017 MA). The BA was submitted during the spring of 2008, and a Biological Opinion (BO) was subsequently issued by NMFS later that year. The current BO expires December 31, 2017, concurrent with the 2008-2017 MA. Impacts to listed salmonid species from fisheries described in this report are expected to be *de minimus*.

### ***Eulachon Smelt***

In March 2010, the National Marine Fisheries Service (NMFS) published a rule (75 FR 13012) to list as threatened under the ESA the southern distinct population segment (DPS) of Pacific eulachon, which became effective May 17, 2010. This DPS encompasses all populations within the states of Washington, Oregon, and California and extends from the Skeena River in British Columbia (inclusive) south to the Mad River in Northern California (inclusive). As a result of this listing, the *U.S. v Oregon* TAC submitted to NMFS an addendum to the current BA, which covered Columbia River fisheries through 2017. This addendum addressed the incidental take of ESA-listed eulachon in Columbia River fisheries. Given that (1) the commercial sale of eulachon from Columbia River and tributary fisheries was prohibited effective December 10, 2010, and (2) the retention of eulachon in Columbia River recreational fisheries was prohibited effective January 1, 2011, impacts to eulachon from fisheries described in this report are expected to be *de minimus*.

### ***Green Sturgeon***

In April 2006, the NMFS published a rule (71 FR 17757) to list the Southern DPS of the North American green sturgeon (those spawning in the Sacramento River, California) as threatened on April 7, 2006, which became effective July 6, 2006. Effective November 9, 2009, the Columbia River below River Mile 46 was designated as critical habitat of the Southern DPS (74 FR 52300). The BO covering non-Indian fisheries described in the 2008-2017 MA also addresses impacts to green sturgeon. Given that (1) the sale of green sturgeon from Columbia River commercial fisheries was prohibited effective July 6, 2006, and (2) the retention of green sturgeon in Columbia River recreational fisheries was prohibited effective January 1, 2007, impacts to green sturgeon from fisheries described in this report are expected to be *de minimus*.

### ***Marbled Murrelet***

The threatened status of the marbled murrelet has not changed since initially listed October 1, 1992 (57 Fed. Reg. 45328, October 1, 1992). On September 24, 1997, the U.S. Fish and Wildlife Service released a recovery plan for the threatened marbled murrelet for the states of Washington, Oregon, and California (USFWS 1997). On June 12, 2009, the United States Fish and Wildlife Service concluded a five year review of the status of the marbled murrelet and determined that no change in the bird's threatened status was warranted (USFWS 2009). On October 4, 2011, critical habitat was designated for the marbled murrelet (61 Fed. Reg. 26256, October 4, 2011). Fisheries described in this report are not likely to adversely affect this species.

# **STURGEON MANAGEMENT AND FISHERIES DOWNSTREAM OF BONNEVILLE DAM**

## **Stock Status**

Sturgeon abundance in the lower Columbia River collapsed at the end of the 19th century due to overfishing and remained depressed through the first half of the 20th century. The population began to rebound only after the adoption of management actions aimed at reducing overall harvest and protecting broodstock, particularly the 6-foot maximum size limit regulation enacted in 1950. White sturgeon abundance subsequently increased significantly through the 1990's and supported robust recreational and commercial fisheries. Abundance of sub-adult fish began declining in the mid-2000s, prompting changes in harvest quotas and retention seasons.

Joint state tagging and recovery programs were initiated in 1986 to provide data necessary to estimate the annual abundance of white sturgeon inhabiting the lower Columbia River. Abundance estimates, based on tagging conducted in one year and mark sampling extending into the following year, have been produced since 1987 with the exception of 1994 and 2004 (the estimates refer to the year of tagging, although final estimates require recoveries through the following year). Abundance estimates for harvestable size fish [42-60 inches total length (TL) or 38-54 inches fork length (FL)] were generally low during 1988-1992 averaging 55,600 but improved significantly during 1993-1997 when average legal abundance was 169,200 fish. The estimates from 1998 through 2007 were lower (131,400 average) but more stable, ranging between 121,600-140,700 fish (Table 1). The most recent estimates declined steeply, from 131,700 fish in 2007 to a low of 65,300 fish in 2010 before increasing to 72,800 fish in 2011 and to 83,400 fish in 2012.

Beginning in 2010, ODFW initiated an additional survey using research setlines during July, August and September to recover white sturgeon tagged in May, June, and July. This "in-year" approach allows researchers to estimate current abundance and to project the next year's abundance.

Concurrent abundance estimates resulting from the "traditional" approach using mark-recoveries through fishery-sampling and the new approach using mark-recoveries from setline sampling are available for 2010-2012 (Table 1). Setline-based estimates are 100,200, 80,500 and 72,700 legal-size fish present at the start of 2010, 2011, and 2012 respectively. These compare to estimates of 65,300, 72,800 and 83,400 legal-size fish present as of May 2010, 2011 and 2012 respectively, using the traditional approach. For 2013, the setline approach produced an estimate of 114,200 legal-size fish. For 2014, the setline-based estimate is 130,990 legal-size fish, with a projected 138,200 legal-size fish for 2015.

Reduced recruitment to the lower end of the legal slot drove the recent decline, with abundance of 42-48 inch TL (38-43 inch FL) white sturgeon averaging 126,900 fish for 1996-2000, 95,200 fish for 2001-2007, before reaching a low of 39,100 fish in 2010. Numbers in this size class increased the following two years, to 46,300 fish in 2011 and to 52,600 fish in 2012. Conversely, the number of fish between 48 and 60 inches TL (43-54 inches FL) increased from an average of 24,000 fish for 1996-2000 to 34,200 fish for 2001-2006 and has since averaged 29,100 fish a year.

An alternative indicator of legal-size abundance, harvest per angler trip in recreational fisheries, remained relatively stable from 1995 through 2007, but declined 26% in 2008 from the previous 13-year average. The decline continued in 2009 and 2010, but at a more modest 10% per year. Starting in 2011, harvest per angler trip increased by 12% in 2011, by 4% in 2012, and by 39% in 2013.

Catch per angler trip (CPUE) of sublegal (<42 inches TL, <38 inches FL) white sturgeon decreased annually from 2004 through 2009 following eight years of mostly steady increases. By 2008, CPUE of sublegal-size fish had dropped by almost 40% of the 1996-2006 average. This declining trend slowed in 2009, decreasing by just 5% that year, then remained relatively stable through 2012 before increasing by almost 6% in 2013.

A recent and substantial threat to the white sturgeon population has been predation by sea lions, especially adult-size fish taken by Steller sea lions (SSL). Observers for the U.S. Army Corps of Engineers (USACE) reported a steady annual increase in the number of individual SSL at Bonneville Dam, from zero animals in 2002 to 89 individual animals in 2011. Observers identified 73, 80 and 65 individual animals in 2012, 2013 and 2014 respectively.

Predation of adult-size fish observed by WDFW and ODFW employees in the vicinity of Beacon Rock peaked during December 2005 through March 2006, with over 50 kills reported. Activity then declined following initiation of a hazing program in March 2006 that successfully moved the SSL out of the area by early April. Hazing was initiated again in February 2007 and from December 2007 through May 2008 and from February through May in 2009 and 2010; however, these efforts grew steadily less effective each year. Crews were often able to distract individuals from feeding, but were not successful in driving them out of the area (the Columbia River gorge). In 2011, WDFW and ODFW staff expanded the area of observation from Tanner Creek (where USACE observations cease) downstream to Rooster Rock State Park, to document rates of predation in this area. Results of this work, combined with USACE observations, indicate significant predation of white sturgeon occurs throughout the 16-mile stretch immediately downstream of Bonneville Dam, with most of activity confined to the upper 10 miles. The WDFW and ODFW observations in the vicinity of Beacon Rock suggest SSL diet in this downstream location is comprised of a higher proportion of adult-size white sturgeon than that documented by the USACE observation program.

The USACE observer program at Bonneville Dam documented a steady increase in total predation of all sizes of white sturgeon through 2011. Estimated consumption of white sturgeon in this small area increased from an observed take of just one white sturgeon in 2005 to 3,003 fish in 2011. An estimated 2,498 white sturgeon were consumed in 2012, and 635 and 147 sturgeon were estimated taken in 2013 and 2014. Even though California sea lions (CSL) are also present in high numbers, most of the observed take is by SSL, with very few incidences of sturgeon predation attributed to CSL.

Predation on smaller white sturgeon throughout the river appears to be increasing in frequency based on observations by staff and reports from anglers and commercial fishers. Predation on larger sturgeon may also be increasing in other parts of the lower Columbia and lower Willamette rivers as well. In 2009, ODFW generated estimates of total annual predation impacts on sturgeon by SSL and CSL in the entire lower Columbia and lower Willamette Rivers as an element of a population viability model they developed. The modeled losses increased from 6,700 fish in 2009 to a maximum of 10,600 fish by 2014. Loss of juvenile fish to predation may

be impacting sublegal abundance and recruitment to fisheries. Loss of adult fish is contributing to lower population productivity and reduced recruitment to fisheries.

In 2011, ODFW completed the Oregon Lower Columbia River and Oregon Coast White Sturgeon Conservation Plan (WCP). WDFW staff was integrally involved in development of the Oregon WCP and the completed plan has since been endorsed by WDFW. The Oregon WCP examines factors and threats that are limiting the abundance and productivity of lower Columbia River white sturgeon, and identified critical unknowns and data gaps pursuant to these factors and threats. Population goals and objectives were developed and strategies and actions identified to address the limiting factors and threats. The WCP was adopted by the OFWC in its entirety in August of 2011.

## **Fishery Management Actions**

Sturgeon fishery management focused on the commercial fishery during the early 1900's and expanded to encompass recreational fisheries beginning in 1940. Regulations for recreational and commercial fisheries became increasingly restrictive and complex as the popularity and importance of sturgeon as a target species increased for both fisheries.

### **Past Management Actions**

Sturgeon management actions were initiated in 1899 with the adoption of a 4-foot minimum size limit for commercially-landed sturgeon. During 1899-1908, commercial sale of sturgeon was prohibited and beginning in 1909, commercial sturgeon sales were allowed during salmon seasons only. Between 1940 and 1989, fishery management actions primarily consisted of modifying catch limits for the recreational fishery and legal size restrictions for recreational and commercial fisheries. Most significant was the adoption of a 6-foot maximum size limit regulation in 1950. The purpose of the maximum size limit restriction was to protect broodstock and aid rebuilding of the Columbia River white sturgeon population. Additionally, commercial sturgeon setline seasons in place during 1975-1983 were discontinued.

Since 1989, the intent of the management strategy for lower Columbia River white sturgeon fisheries was to optimize harvest while allowing for the continued rebuilding of the population. Significant management actions taken during 1985-1996 to restrict catches to sustainable levels included: (1) increasing the minimum size limit in recreational fisheries; (2) reducing the maximum size limit in all fisheries; (3) reducing daily and annual catch limits for recreational fisheries; and (4) adopting annual catch guidelines for commercial fisheries.

Primarily due to angling regulation changes, recreational catch dropped from a peak of 62,400 fish in 1987 to a low of 17,300 fish in 1990. During the same period, commercial catch also dropped from a peak of 11,600 fish in 1986 to a low of 3,800 fish in 1991, due to reductions in fishing opportunities. In 1985, recreational regulations allowed for a daily catch limit of three fish between 36 and 72 inches total length with no annual catch limit. The maximum size limit for all white sturgeon fisheries was reduced from 72 inches to 66 inches TL in 1993. In 1996, recreational regulations were further restricted with a daily catch limit of one fish between 42 inches TL (equivalent to current 38 inch FL) and 66 inches TL and a ten fish annual catch limit. The maximum size limit for both fisheries was reduced from 66 inches TL to 60 inches TL (equivalent to current 54 inch FL) in 1997. Tables 6 and 8 summarize annual Columbia River regulations.

These regulation changes culminated in adoption of WFWC policy C-3001 on Lower Columbia Sturgeon Management and in a series of one to three year Joint State Management Agreements (Accords) between Washington and Oregon that have guided Columbia River sturgeon management since 1997.

### **Past Joint State White Sturgeon Management Agreements**

The Accords have contained a variety of fishery regulations including: (1) size limits for recreational and commercial fisheries; (2) daily and annual catch limits for recreational anglers; (3) gear restrictions for recreational and commercial fisheries; (4) the allowance of target sturgeon seasons in the commercial fishery; and (5) protective measures for adult-size sturgeon.

One aspect of most of the agreements through 2009 was the adoption of a three-year average harvestable number of sturgeon designed to reduce the risk of fishery impacts exceeding what is deemed sustainable. The harvestable number has been allocated 80% for recreational fisheries and 20% for commercial fisheries since implementation of the first Accord in 1997.

The tenets of the Accords also allowed for modifications if new information suggested that a change was warranted. Since adoption of the first sturgeon Accord, additional management actions have been necessary. Abundance of legal-size fish did not increase as expected during the first two years of the first Accord, and based on this new information, the annual harvestable number was reduced from 67,300 to 50,000 fish for 1999 fisheries.

In December 2002, the WFWC and OFWC (Commissions) established sturgeon management protocol to help guide the development of recreational and commercial fisheries during 2003-2005. Due to the declining trend in abundance, the Commissions adopted a reduction in the annual harvestable number from 50,000 fish to 40,000 fish per year for 2003-2005. This reduction generated a conflict in season-shaping preferences among competing recreational interests for the areas downstream (estuary) and upstream (non-estuary) of the Wauna powerline crossing at river mile (RM) 40. After much debate, the Commissions allotted 60% of the recreational share to the estuary fishery and 40% to the non-estuary or above Wauna fishery.

By 2004, work with the Columbia River Recreational Fisheries Advisory Group (CRRAG) had established that fishery goals tended to differ for those who participated in the estuary fishery compared to those who participated in the non-estuary fishery. For the area above the Wauna powerlines, anglers preferred retention opportunity throughout as much of the year as possible, especially during the spring and fall timeframes. A days-per-week approach was adopted to achieve this, with retention allowed on Thursdays, Fridays, and Saturdays, and catch-and-release allowed on non-retention days. Retention was prohibited during August and September to ensure that the annual harvest guideline lasted through the fall timeframe. For the estuary fishery, anglers preferred retention opportunity seven days per week, and a retention season that lasted at least through July 4. To achieve this, beginning in 2004, the minimum size limit for this area increases in May each year to 45 inches TL (41 inch FL equivalent since 2009) to slow catch rates in the estuary and prolong the retention season. This modification required the annual guideline for the estuary be reduced by 17% (from 19,200 fish to 16,000 fish) to maintain a comparable overall harvest rate. These basic season structures have continued in subsequent Accords. Other changes to recreational fishery regulations enacted during 2004-2005 included reducing the annual limit from ten fish to five fish, and requiring anglers to use one single-point barbless hook.

The fourth Joint State Accord covered the three-year period from 2006-2008. The major tenets from the prior accord remained intact, including the 40,000 fish annual harvestable number (36,800 fish actual following adjustments to the estuary guidelines), the 80% recreational and 20% commercial allocation, and the 60% estuary and 40% non-estuary recreational sub-allocation. The agreement also called for basic monitoring of marine mammal predation of white sturgeon.

The maximum size limit for green sturgeon in the commercial fishery was lowered from 66 inches TL to 60 inches TL for 2006-2008 to provide additional protection to the species. However, when green sturgeon were ESA-listed as threatened (effective July 6, 2006) the states subsequently prohibited sales (and therefore retention) of green sturgeon from Columbia River commercial fisheries effective July 6, 2006 and retention of green sturgeon in Columbia River recreational fisheries effective January 1, 2007.

The 2006-2008 Joint State Accord for Columbia River sturgeon management was renewed for 2009 to allow for development of the Oregon WCP and refine a strategy for long-term lower Columbia River white sturgeon management. Also in 2009, Oregon and Washington converted from a total length to a fork length measurement standard in all fisheries. The conversions for slot measurements were as follows: 42-inch TL = 38-inch FL; 45-inch TL = 41-inch FL; 48-inch TL = 43-inch FL; 60-inch TL = 54-inch FL.

Due in part to the quickly changing status of the population, the Joint State Accord was again renewed for just one year in 2010. The updated WFWC policy C-3001 called for a reduction in harvest of no less than 45% from the previous level, to address the declines in abundance and uncertainties surrounding the impact of predation. Negotiations between the Directors of the ODFW and WDFW resulted in a 2010 Accord that set the harvestable number at 24,000 fish for 2010; a 40% reduction from the previous guideline.

Prior to implementation of the first Accord, the agencies in 1996 adopted a no-sturgeon-angling sanctuary just downstream from Bonneville Dam to protect spawning white sturgeon. A boat-based catch-and-release fishery targeting sturgeon larger than the legal-size limit (oversize) had been intensifying in this area since 1990. Angling for sturgeon from boats was prohibited during May and June within this sanctuary, which extended 4.5 miles downstream to Beacon Rock. In 2000, this closure was extended through mid-July to provide additional protection to the adult population.

In 2004 the duration of the sturgeon-angling prohibition within the spawning sanctuary was extended through July and the bank fishery was incorporated into the closure. Washington adopted a regulation extending the sanctuary boundary an additional 1.6 miles further downstream to U.S Coast Guard (USCG) Navigation Marker 85. Oregon did not adopt this change and Washington rescinded the regulation in order to maintain concurrence with Oregon. Instead, the Joint State Agreement was modified to include a "Best Fishing Practices" program that identified angling practices designed to maximize post-release survival rates in the oversize catch-and-release fishery. The spawning sanctuary boundary was eventually moved the 1.6 miles downstream to USCG Navigation Marker 85 with adoption of the 2006-2008 Accord.

In 2010, the Director's agreed to move the sanctuary's downstream boundary to USCG Navigation Marker 82 adjacent to the upper end of Skamania Island, closing about 9 mile of river to sturgeon angling. The closure period was extended an additional month; covering May through August. Also in 2010, the state of Oregon established a spawning sanctuary in the

Willamette River from the I-205 Bridge upstream to Willamette Falls during May 1-August 31 following documentation of successful white sturgeon spawning in this area. The Willamette River sanctuary was expanded in 2013 by moving the downstream boundary to the Lake Oswego-Oak Grove Railroad Bridge.

### **Current Joint State White Sturgeon Management Agreement**

A new three-year Accord was adopted by the Commissions in February of 2011 to cover the years 2011-2013. No changes were made to allocations among fisheries or areas, and spawning sanctuaries remained as adopted in 2010. However, harvest guidelines during the period were established as a 22.5% annual harvest rate or a cap of 17,000 total harvested fish, whichever was lower. This harvest level was to be derived annually from projected abundance in the coming year, based on in-year stock assessment abundance estimates. This resulted in a guideline for 2011 that was 29% below the 2010 level.

The 2011-2013 Accord was amended for 2012 to reflect revised policy guidance based on continued concern for the status of the population. The 2012 Amendment specified that the 2012 harvest guideline be based on a 16% harvest rate of the legal-size segment of the population, or 10,400 white sturgeon. The Amendment resulted in a 39% reduction in the guideline, which was allocated as follows for 2012: 2,080 commercial; 4,992 below Wauna (adjusted to 4,160 to reflect the change in the minimum size limit during the summer season); 2,080 mainstem above Wauna; and 1,248 for the lower Willamette River.

Additional guidance was provided by the Commissions for 2013. A Columbia River Fishery Management Workgroup, formed in 2012 to develop strategies and recommendations for restructuring Columbia River fisheries, developed two specific recommendations for LCR sturgeon fisheries. First was to allocate just 90% of the harvest guideline derived from the 16% harvest rate, holding 10% in reserve as a conservation buffer. The second recommendation was to consider implementing rules prohibiting retention of LCR origin white sturgeon if a decline in legal-size abundance forecast for 2012 held true, which turned out to be the case.

In response to the reduced 2013 guideline, each Commission adopted reduced statewide annual recreational bag limits, from five fish to two fish, effective April 2013. In addition, the Directors negotiated a 15% hold-back in the harvest guideline for 2013 fisheries. The 16% allowable harvest rate was reduced to 13.6%, resulting in a 10,105 fish guideline allocated as follows for 2013: 2,021 commercial; 4,850 below Wauna (adjusted to 4,042 to reflect the change in the minimum size limit during the summer season); 2,021 mainstem above Wauna; and 1,213 for the lower Willamette River (1,733 with 520 fish baseline added in).

Also in 2013, the OFWC adopted rules prohibiting retention of white sturgeon in the LCR, lower Willamette River, and Oregon coast effective January 1, 2014. The WFWC adopted similar rules, prohibiting white sturgeon retention effective January 1, 2014 in the LCR, Washington coast, Puget Sound, and their tributaries.

### **Adjustments for Harvest outside the Mainstem Columbia River**

Past harvest guidelines and allocations identified in the Joint State management agreements pertained specifically to harvest in the mainstem Columbia River (and Select Areas) downstream of Bonneville Dam. However, white sturgeon from the lower Columbia River migrate into and are harvested in various Columbia River tributaries and coastal estuaries. Harvest outside the

Columbia is generally low, averaging 2.6% based on 1996-2007 tag recovery data but can be higher as observed in 1996 when tag recoveries from outside the Columbia River increased to 5.3%. During that year, harvest of white sturgeon along the coast correspondingly peaked at a level more than double the average harvest for the previous decade. This phenomenon was recognized as a concern, so the Columbia River harvest guideline identified in the original 1997-1999 Joint State Management Agreement was adopted with the contingency that it could change with a substantial increase in harvest outside the Columbia system. To assure that future harvest guidelines and allocations remained equitable, the Commissions adopted policy in the 2000-2002 and subsequent Joint State agreements, calling for management of sturgeon harvest outside the mainstem Columbia River to be consistent with Columbia River conservation and management needs.

The 2000 Willapa Bay Fishery Management Framework (plan) was developed to address the Joint State agreement policy. The Willapa Framework incorporated white sturgeon harvest guidelines for commercial and recreational fisheries based on the historic relationship between Willapa Bay and Columbia River harvest levels. The Willapa Bay guideline was adjusted by the same (20%) reduction made to the Columbia River guideline in 2003, resulting in a 1,769 fish guideline. Since adoption of the plan, non-Indian commercial harvest in Willapa Bay has declined; however, treaty harvest in Grays Harbor and tributaries has generally increased. Collectively, the combined harvest has remained fairly consistent since 1997. The Willapa guideline was adjusted downward 40% in 2010, by 29% in 2011, and by 39% in 2012 to keep in step with the reductions adopted for the lower Columbia River. Effective January 1, 2014, retention of white sturgeon will be prohibited along the Washington coast, including all coastal tributaries.

In 2012 Washington implemented restrictions to Puget Sound recreational sturgeon fisheries. The year-round retention season was reduced to two retention periods, June 1-30 and September 1 through October 15. Effective January 1, 2014, retention of white sturgeon was prohibited in Puget Sound and its tributaries.

Since 2004, there has been a significant shift in the winter and early spring recreational sturgeon harvest from the mainstem Columbia into the Willamette River. This shift may be due to warmer (2-5°F higher) winter water temperatures in the Willamette and generally poor eulachon returns to the Columbia through 2012 that appear to be attracting more fish (and recreational fishers) to the Willamette River during January-May. Because of this increasing trend, staff recalculated harvest estimates (and adjusted guidelines) for the Willamette recreational fishery to account for harvest in excess of the 1986-1996 baseline level (or adjusted baseline in more recent years). The adjusted estimates for the Willamette River have been added to catch totals in the fishery above Wauna to more accurately reflect the total recreational harvest for this river section.

The harvest adjustments (increases) for the Willamette were based on information available from the ODFW creel survey and angler punch card data during 2004-2009 (Table 3). Prior to 2009, the Willamette River creel program has been directed at estimating harvest of spring Chinook salmon. Accordingly, the program has typically only operated from March through June of each year. In order to derive full-year catch estimates, including timeframes not included during creel surveys, staff used adjusted catch record card estimates. Catch estimates from catch record cards for the time period in which creel surveys were conducted were compared with catch estimates

from creel surveys to derive a ratio of creel and catch record derived catches. This ratio was then applied to catch record card harvest estimates for time periods outside the creel survey period.

In 2009, the Willamette creel program was expanded to include the January-February timeframe, but catches in the remainder of the open season were still generated by the catch card/creel survey ratio method. Since 2010, the creel survey has been conducted during all timeframes in which retention was allowed, and no expansions for non-sampled periods are necessary. Based on the above methods, annual white sturgeon harvest in the Willamette River averaged 1,531 fish (range 989-2,206) during 1986-1996, 1,871 fish (range 1,263-2,811) during 1997-2003, and 5,193 fish (range 2,327-9,148) during 2004-2010. Since 2010, the lower Willamette River recreational sturgeon fishery has been managed under a separate harvest guideline. The Amendment to the Accord specified a 1,768 fish guideline for the Willamette River in 2012, including the baseline of 520 sturgeon. The guideline for 2013, including baseline, was 1,733 fish.

## **Sturgeon Fisheries**

Reduced salmon fishing opportunities during the mid-1970s through the late 1990s greatly increased the popularity and importance of sturgeon for both commercial and recreational fisheries. The healthy white sturgeon population allowed the commercial industry to develop stable fisheries in a time when commercial salmon fishing opportunities had been drastically reduced. A similar lack of stable recreational salmon fisheries and recognition of white sturgeon as a sport fish resulted in increased popularity of sturgeon angling since the mid-1980s. In recent years, reduced white sturgeon catch guidelines have impacted the stability of all Columbia River sturgeon fisheries. Based on Commission guidance, retention of white sturgeon in Columbia River commercial and recreational fisheries has been prohibited since January 2014.

### **Past Commercial Sturgeon Fisheries**

Since the late 19<sup>th</sup> century, commercial catch of sturgeon remained very low until the mid-1940s. Through 1968, annual landings only exceeded 5,000 fish occasionally. Since 1969, landings exceeded 5,000 fish annually except in 1991 and 2010-2014. Catches peaked in the late 1970s and early 1980s with annual landings ranging from 9,400 to 22,800 fish. During the 1990s, catches ranged from a low of 3,800 fish in 1991 to a high of 13,900 fish in 1998 (Tables 4 and 10). During 1997-2013, commercial sturgeon fisheries were managed to remain within catch guidelines while maximizing economic benefit and achieving conservation objectives for other species. Annual plans for distribution of the commercial harvest allocation are developed with input from the Columbia River Commercial Fisheries Advisory Group (CRCAG), to provide fishing opportunities throughout the year while maintaining optimum market value. Weekly landing limits remained a valuable tool in maintaining consistent commercial fisheries since first adopted in 2002. During 2003-2013, harvest guidelines for commercial fisheries included both mainstem and Select Area commercial fisheries. The retention of green sturgeon has been prohibited in commercial fisheries since July 2006. Season summaries are described in Table 6.

## **2014 Commercial Fishery**

Based on Commission guidance, white sturgeon retention and sales in 2014 Columbia River commercial fisheries were prohibited. For this reason, a mainstem winter commercial fishery was not adopted for the first time since 1995. White sturgeon retention and sales remain closed throughout spring, summer, and fall commercial seasons.

## **Past Recreational Sturgeon Fisheries**

Recreational harvest guidelines for white sturgeon decreased steadily from 54,000 fish in 1997 to 8,100 fish in 2013 in response declining white sturgeon abundance. During the same time period, sturgeon angler trips declined from over 200,000 trips per year to just over 33,000 trips in 2013. Based on guidance from the OFWC and WFWC in December 2013, sturgeon fisheries in the lower Columbia River closed to sturgeon retention effective January 1, 2014 (Tables 2 and 8).

## **2014 Recreational Sturgeon Fishery**

### Above Wauna (non-Estuary)

Regulations for the Columbia River and adjacent Washington tributaries upstream of the Wauna power lines (RM 40) prohibited the retention of sturgeon January 1-December 31 (Table 8). Catch-and-release angling was allowed during all retention closures, except in the area of Sand Island Slough during January 1-April 30 and in the spawning sanctuary between Marker 82 and Bonneville Dam during May 1-August 31.

### Below Wauna (Estuary)

Regulations prohibited the retention of white sturgeon below Wauna power lines January 1-December 31 (Table 8). Catch-and-release angling was allowed during all retention closures.

### Summary of 2014 Recreational Harvest

Recreational sturgeon fisheries in the lower Columbia and lower Willamette rivers were closed to retention in 2014. As in the past, angler participation in the catch-and-release fishery was minimal. Through August 31, 2014 anglers made 2,800 trips for sturgeon below Bonneville Dam and released 10,145 white sturgeon (Table 9).

## **2015 Non-Indian Sturgeon Fisheries Expectations**

Based on current OFWC administrative rules and WFWC policy, all recreational and non-Indian commercial fisheries in the Columbia River and tributaries downstream of Bonneville Dam will be closed to the retention of white sturgeon during 2015. The only retention fisheries for white sturgeon currently planned for 2015 will be upstream of Bonneville Dam and in the Willamette River upstream of Willamette Falls.

# **STURGEON MANAGEMENT AND FISHERIES UPSTREAM OF BONNEVILLE DAM**

## **Stock Status**

The healthy white sturgeon population in the lower Columbia River historically ranged into areas above the current location of Bonneville Dam; however, with the construction of Bonneville Dam in 1938, the population became segregated and fish residing upstream could no longer migrate freely between freshwater and marine environments. The population became further segregated with the completion of McNary Dam in 1953, The Dalles Dam in 1957, and John Day Dam in 1968, resulting in functionally separate populations in Bonneville, The Dalles, John Day, and McNary pools as well as each of the upriver pools as other dams were constructed. Inaccessibility to the marine environment and habitat alterations, primarily due to hydroelectric development, has rendered these populations less productive than those residing below Bonneville Dam.

Abundance of white sturgeon populations in each of the three Zone 6 reservoirs (between Bonneville and McNary dams) is estimated every three years to monitor the effects of hydro-system operations and fishery management strategies. Mark-recapture population estimates are derived using directed sampling with gill nets and setlines. Significant harvest reductions were enacted beginning in 1988 and populations in all three reservoirs increased as a result of reduced catch and other mitigation efforts. The most recent assessments estimated the abundance of legal-size sturgeon to be 14,210 38-54 inch FL fish in Bonneville Reservoir (2012), 9,620 43-54 inch FL fish in John Day Reservoir (2013), and 1,850 43-54 inch FL fish in The Dalles Reservoir (2014 preliminary). Prior estimates back to 1976 of 33-65 inch FL (36-72 inch TL) fish are presented in Table 11.

## **Fishery Management Actions**

The Sturgeon Management Task Force (SMTF) consists of representatives from Oregon, Washington, and the Columbia River treaty Indian tribes (Nez Perce, Umatilla, Warm Springs, and Yakama). The SMTF was formed in 1987 in response to concerns over increasing catches (non-Indian recreational and treaty Indian commercial and subsistence) and declining white sturgeon abundance in the Zone 6 area. The purpose of the SMTF is to review the status of sturgeon and provide harvest management recommendations for fisheries occurring in the Zone 6 management area. Treaty sturgeon fisheries do not currently occur upstream of McNary Dam, so this area is not considered in SMTF harvest sharing agreements.

The current harvest allocation is approximately 38 percent recreational and 62 percent treaty for Zone 6, although reservoir-specific guidelines are shaped to meet fishery demands. The recreational and treaty Indian fisheries are allowed an equal share of the Bonneville Pool catch, while the treaty Indian fishery is allowed a much greater share of the catch in The Dalles and John Day pools. Treaty Indian fishers may continue to take sturgeon for subsistence purposes after commercial seasons have been completed, and this catch is not included in the commercial catch guidelines. Subsistence catch is estimated through a monitoring program conducted by the tribes, and has averaged 332 sturgeon annually since 2005, ranging from 123 to 652 fish (Table 12).

## Sturgeon Fisheries

Sturgeon fisheries in Zone 6 consist of treaty-Indian commercial and subsistence fisheries and non-Indian recreational fisheries. Non-Indian fishing is restricted to hook-and-line recreational fishing only, while treaty Indian commercial fishing is conducted with three main types of gear: hook-and-line, setlines, and gillnets, although small numbers of legal sized sturgeon can be caught from hoop-nets.

In recent years, most treaty sturgeon catch has occurred in the winter season. Under permanent regulations, treaty commercial setline fisheries are open in all three Zone 6 reservoirs during January 1-31. A winter commercial gillnet fishery normally begins February 1 and continues no later than March 21, but is often closed earlier if sturgeon harvest guidelines are met in any pool (Table 13). In some years, the tribes allow commercial setline fishing in the summer or fall seasons. Treaty Indian subsistence sturgeon seasons are open the entire year, as were recreational seasons prior to 1994. Most treaty subsistence harvest occurs in association with salmon fisheries occurring throughout the year. Since 1994, the sturgeon recreational fishery and treaty Indian commercial fisheries have been managed under reservoir-specific harvest guidelines. Catch-and-release recreational fishing is allowed once recreational guidelines are reached (Table 14).

Fisheries occurring in Zone 6 are managed in accordance with catch guidelines set forth by the SMTF (Table 15). Due at least in part to intensive fishery management, abundances of legal-sized fish in the Zone 6 pools have generally increased since the early-to-mid 2000s. In some pools, this increase has been dramatic. These trends have allowed for recent increases in harvest guidelines in most areas.

### 2014 Treaty Indian Fisheries

The 2014 treaty Indian winter setline fishery harvested 8 sturgeon from Bonneville Pool which represented approximately 0.7% of the 1,100 fish commercial guideline. No fish were harvested in The Dalles Pool. Setline fishers landed 64 sturgeon from John Day Pool which represented approximately 6.4% of the 1,000 fish commercial guideline. The slot limit sizes for sturgeon retention were between 43-54 inches fork length in The Dalles and John Day pools and between 38-54 inches fork length in the Bonneville Pool. The balance of the Zone 6 treaty harvest was caught during the winter gillnet fishery and fall setline fishery (Tables 15 and 16).

The Bonneville Pool winter gillnet fishery began on February 1 with a slot limit change to match the other pools (43 inches to 54 inches FL). The Bonneville Pool fishery ran until March 15 but the guideline changed back to 38-54 inches FL on March 1. During February 1-28, 34 sturgeon were harvested in the Bonneville Pool. An additional 602 sturgeon were harvested during March 1-15.

The Dalles Pool fishery opened on February 1 and closed temporarily on March 3. It was re-opened on March 12 and continued until March 21. A total of 345 sturgeon were harvested. A fall season setline fishery is currently ongoing.

The fishery in the John Day Pool began on February 1 and closed on February 26. A total of 1,198 sturgeon were landed.

Seasonal totals amounted to 34%, and 120% of the respective harvest guidelines for The Dalles, and John Day pools. The guideline for the Bonneville Pool based on the 38-54" slot limit was 1,100. A specific guideline for the 43-54" slot limit was not adopted (Table 16).

Treaty Indian subsistence sturgeon fishing is open year-round, with sanctuary closures around dams and tributaries. The subsistence fishery catch in 2014 is estimated to be 123 fish, or 35% of the recent 10-year average of 347 white sturgeon (Table 12). The subsistence catch since 2010 has averaged 441 fish.

### **2014 Non-Indian Recreational Fisheries**

Recreational retention seasons for each Zone 6 pool began January 1 and remained open until pool-specific catch guidelines were reached, except the retention season in Bonneville Pool was split into winter and summer segments.

The winter season in Bonneville Pool was open to retention January 1-19, February 1-17, and February 24-March 9 to catch the first half of the guideline. As of March 10 only 241 had been retained. On March 27, the Compact adopted a four-day summer retention season for the weekends of June 13-14 and June 20-21. Harvest for that period was below expectations, with 632 fish kept. On July 1 the Compact adopted another four-day retention season for the weekends of July 11-12 and July 18-19. The fishery was closed on July 20 with a season total catch estimate of 910 fish for Bonneville Pool (Table 15). Due to concern regarding increased handle of over-sized white sturgeon in recent years, a May-July spawning sanctuary extending from The Dalles Dam 1.8 miles downstream was also implemented in 2014.

Retention continued through July 31 in The Dalles Pool and through June 13 in the John Day Pool (Table 14) with preliminary catches of 121 and 465 fish, respectively. The combined Zone 6 recreational catch of 1,496 was 79% of the total guideline of 1,900 white sturgeon (Table 15).

The retention season for McNary Pool/Hanford Reach and the Snake River below Ice Harbor Dam was open from February 1 through July 31, per permanent regulation. Due to normal delays in angler catch record card reporting, a 2014 recreational harvest estimate for McNary Pool/Reach and the Lower Snake River is not available. The Snake River from Ice Harbor Dam to Lower Granite Dam is open to retention year-round. The section from Lower Granite Dam to the Idaho border is open year-round for catch and release only.

### **2015 Zone 6 Sturgeon Fisheries Expectations**

The SMTF is scheduled to meet January 21, 2015 to review 2014 management, results of the 2014 stock assessment in The Dalles Pool, and to discuss management of 2015 fisheries.

As per permanent regulations, treaty Indian winter commercial seasons include a setline season scheduled for January 1-31, 2015 and a gillnet fishery scheduled to begin on February 1, 2015.

As per permanent regulations, Zone 6 recreational seasons begin January 1, 2015 and continue until guidelines are met in The Dalles and John Day pools. The season will be split in Bonneville Pool, as it has been since 2011. Per permanent regulation, McNary Pool/Hanford Reach and the Snake River below Ice Harbor Dam will be open to retention February 1 through July 31. Also, the Snake River from Ice Harbor Dam to Lower Granite Dam will be open to retention year-round, and from Lower Granite Dam to the Idaho border will be open year-round for catch and release only.

# SMELT MANAGEMENT AND FISHERIES

## Stock Status

Eulachon (also known as Pacific or Columbia River smelt) return annually to the Columbia River to spawn in the mainstem and several of its tributaries downstream of Bonneville Dam. The fish typically begin to enter the Columbia River in December. Eulachon return to fresh water as early as age two and as late as age 5 (most returning at ages three and four). Peak tributary abundance is usually in February, with variable abundance of adults through April.

Spawning can occur in the lower Columbia River Basin soon after freshwater entry. Eulachon spawn in both the mainstem and some lower river tributaries. Eulachon typically spawn annually in the Cowlitz River, with inconsistent runs and spawning events occurring in the Grays, Skamokawa, Elochoman, Lewis, Kalama, and Sandy rivers. Eulachon are broadcast spawners, preferring areas with a coarse, sandy bottom. Females produce 20,000 to 60,000 eggs and the adults die following spawning. The adhesive eggs settle to the bottom and incubate for about 30-40 days, depending on water temperature. Young eulachon larvae are about four mm in length and drift with the current to sea.

Effective May 17 2010, the Southern Distinct Population Segment (DPS) eulachon were federally-listed as threatened under the ESA. This genetic group is comprised of eulachon spawning in rivers from the Skeena River in British Columbia (inclusive) to the Mad River in Northern California (inclusive). Of the numerous streams and rivers in this geographic area, the Columbia River has the largest spawning run.

## Adult Returns

Although commercial landings are not applicable for developing annual population estimates because they are influenced by consumer demand, season structure, and environmental conditions, they do provide a useful measure of the relative annual run strength (Table 17 and 18). The smelt fishery can be traced back to the late 1800's. Commercial landings from 1938-1992 were in the millions of pounds annually. In 1993, eulachon strayed into many Washington coastal streams and bays due to cold Columbia River water temperature, and only 500,000 pounds were landed in the Columbia River and tributaries. Landings in 1994 were only 43,000 pounds, and beginning in 1995, fishery restrictions were enacted. In 2002 and 2003 commercial harvest increased, but decreased again in 2004 and 2005.

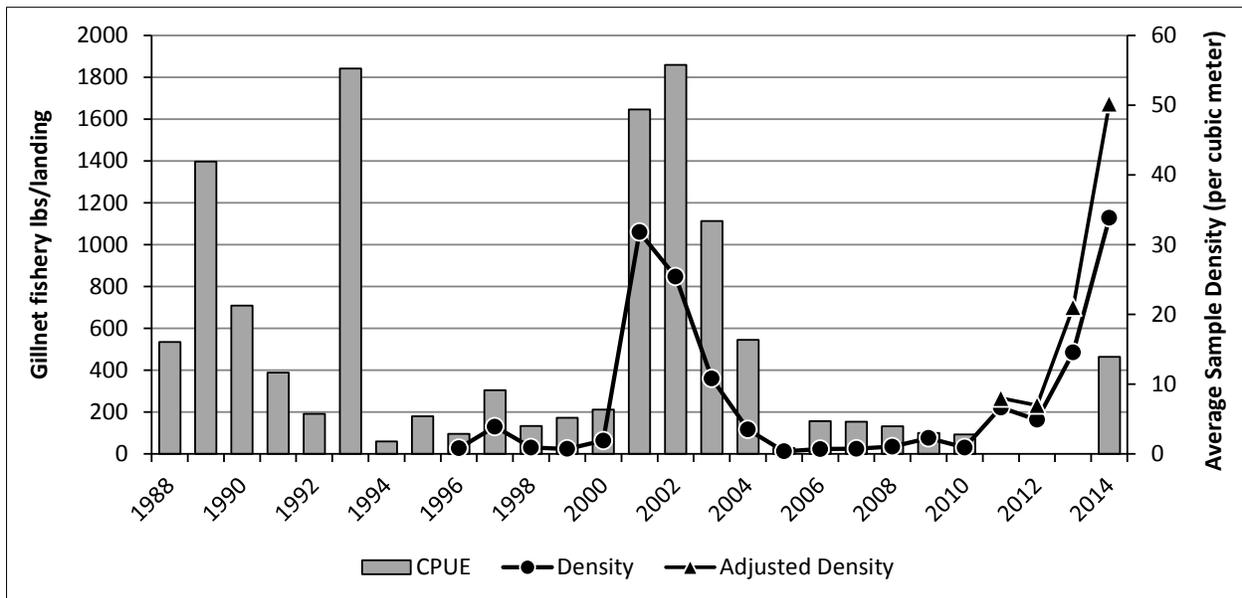

Other populations of eulachon along the Pacific coast of Canada experienced a similar pattern of declines during this period. A precipitous drop occurred in the 2005 Canadian Department of Fisheries and Oceans' (CDFO) New Westminster test fishery for adult eulachon returning to the Fraser River. In 2006 the northern British Columbia (BC) stock (e.g. Skeena River), and central BC stock (e.g. Bella Coola River) groups collapsed, along with the southern stocks (Fraser River and Columbia River).

During the winters of 2007-2009, Columbia River landings improved slightly while catch per unit effort (CPUE) dropped. Both the landing numbers and CPUE dropped off significantly in 2010. Oregon and Washington waters were closed to the harvest of eulachon during 2010 - 2013, so no landing or CPUE information is available (Tables 17 and 18); however, there was anecdotal evidence (general observations by the public backed by juvenile production estimates) of adult presence improving during 2011, 2012, and 2013. A very short commercial season was

allowed during 2014 for research purposes. The modest commercial landings and CPUE (Tables 17 and 18, Figure 1) were not consistent with the angler success in the sport fishery or with the spawner biomass estimation for 2014.

### Juvenile Production

Beginning in the early 1990's, a more direct measure of brood-year strength was developed based on the density of emigrating eulachon larvae averaged across stations and depths at selected index sites located downstream of spawning areas in the mainstem Columbia River and key tributaries (Table 19). Beginning in 2003, multiple collections were conducted at the mainstem Columbia River (Price Island and Clifton Channel) site throughout the outmigration season, which provide the data necessary to identify the peak timing and duration of the outmigration from the bulk of the production area. Average larval densities have improved significantly since 2010 (Figure 1 and Table 19). Prior to 2014, annual eulachon larval densities for the mainstem Columbia River site correlated well with the adult CPUE trend from commercial mainstem fisheries (Figure 1).

**Figure 1.** Comparison of CPUE of eulachon in mainstem Columbia River commercial fisheries and larval densities in mainstem Columbia index sites, 1988-2013. Adjusted density is February through April only for 2011, 2012, and 2013, which is more comparable to pre-2011 sampling periods. CPUE are not available for 2011, 2012, and 2013 due to fisheries being discontinued.

### Spawning Stock Biomass (SSB)

During the 2011-2014 seasons, the larval density data was analyzed with information on daily river flow and adult gender ratios and fecundity values to derive annual estimates of spawning stock biomass (SSB) for areas above the mainstem Columbia River larval sample site (Clifton Channel / Price Island transect). The spawning stock biomass is expressed in pounds (or metric tons). On average there are 10 to 11 adult eulachon to a pound. The SSB for the Columbia River was estimated at: 3,300,000 pounds in 2011; 3,200,000 pounds in 2011/12; 9,600,000 pounds in 2012/13; and, 16,400,000 pounds in 2014. The only notable eulachon spawning area below this transect site is the Grays River. Grays River SSB estimates were made during 2011-

2013, but not during 2014. The SSB estimates for the Grays River are only 0.02% of the estimates for the mainstem Columbia River.

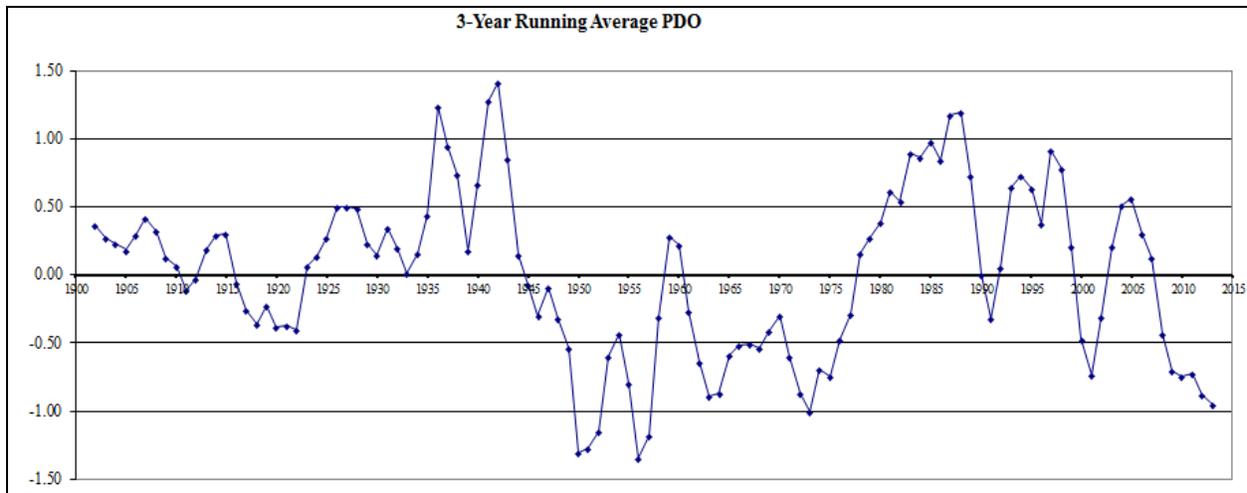

The SSB is an estimate of the minimal number of spawners needed to have produced the eulachon larval outflow observed. To derive an estimate of the run size returning to the Columbia River, one needs to at least expand the SSB estimate by estimates of commercial, recreational, and tribal harvest. Adding the commercial, sport and tribal harvest to the SSB yields a run size estimate of 16,600,000 pounds for 2014.

The SSB approach has been used in other major eulachon spawning rivers (Fraser River 1995-2014; Bella Coola River 2001-2007) and in the coming year will also be applied to other river systems within the range of the Southern DPS population (Naselle River and Chehalis River in Washington, and Ten-mile Creek and Cummins Creek in Oregon). The Cowlitz Tribe will also be doing an SSB estimate for the Cowlitz River, which potentially will allow us to determine how much the Cowlitz River contributes to the overall Columbia River eulachon production.

### Ocean Survival

All Oregon/Washington/British Columbia stock groups have remained depressed since the 2006 coast-wide collapse, suggesting that protracted poor ocean conditions were prevalent off the coast of Oregon, Washington, and British Columbia. Scientists have developed various indices of oceanic environmental conditions. Of these, the Pacific Decadal Oscillation (PDO) Index and the Southern Oscillation Index (SOI) are useful in estimating how well smelt survive their ocean-phase.

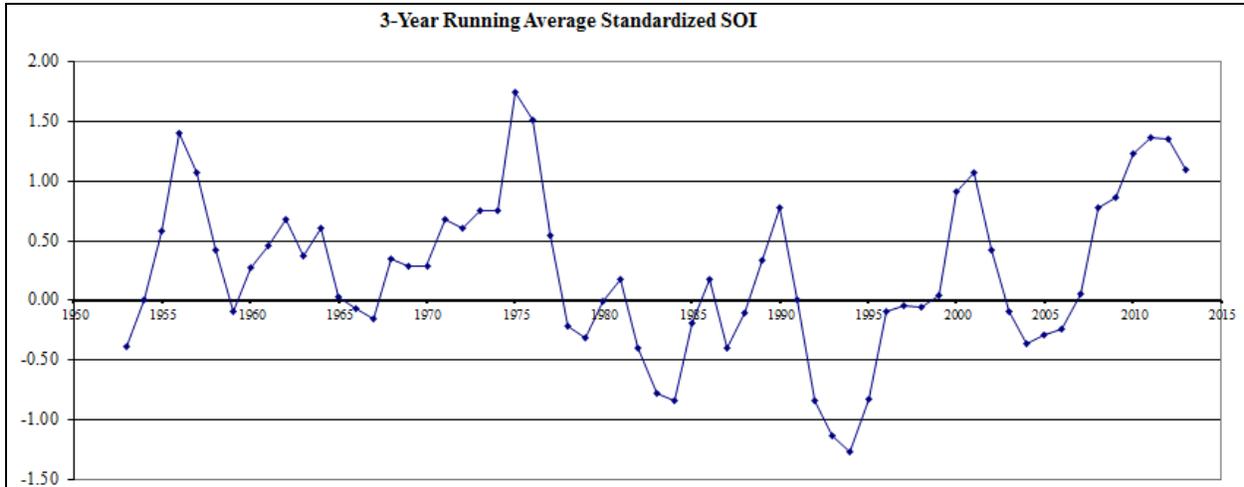

The PDO is an index based on North Pacific sea surface temperature and pressure that correlates with changes in northeast Pacific marine ecosystem productivity. Warm PDO eras have coincided with enhanced coastal ocean biological productivity in Alaska and inhibited productivity off the west coast of the contiguous United States, while cold PDO eras have coincided with the opposite pattern. Conditions have been warming over the past year, but still considered generally favorable for eulachon (Figure 2).

**Figure 2.** Three-year running average values for the Pacific Decadal Oscillation (PDO) Index.

Recent trends in eulachon abundance also follow the SOI, which describes El Niño and La Niña events. Generally speaking, El Niño events are unfavorable for ocean phase eulachon, while La

Niña events are cooler and therefore more favorable. Such favorable conditions are indicated in the recent three-year running averages of the Standardized SOI (Figure 3).

**Figure 3.** Three-year running average values for the Southern Oscillation Index (SOI).

Run strength predictions for the upcoming year are complicated by the variability in the ocean indices in the three years prior. Periods of good ocean conditions do not necessarily make up for the negative survival impact during periods of bad ocean conditions.

Various other marine condition indicators have been examined. Most of these indicators point toward favorable ocean conditions. While the upwelling off the coast has been weak in recent years, the food base has been relatively abundant and of good quality. The copepods off of Newport, Oregon have been mostly composed of the nutritionally-rich northern species since late 2010.

A more direct measure of ocean survival can be obtained from eulachon marine harvest data. Columbia River smelt are caught in the spring shrimp fisheries off the West Coast of Vancouver Island (WCVI); therefore bycatch and test fishery information gathered by the CDFO during their annual spring shrimp surveys can be used as an indicator of Columbia River returns (Table 20). This data has been available until 2013, when CDFO stopped making estimates of the smelt biomass. For 2010-2012, the biomass of Age 1+ eulachon in the test fishery has been increasing, reaching a level in 2012 not seen in a decade. This would bode well for Age 4 returns to the Columbia River during 2015. The biomass estimate for Age 2+ fish in the 2012 WCVI shrimp fishery was strong, which would suggest a fairly good return to the Columbia River of Age 5 fish in 2015. While biomass estimates are not available for recent years in either the WCVI shrimp trawl fisheries or for U.S. West Coast shrimp trawl fisheries, on-board monitors have indicated that eulachon numbers have remained strong during 2013 and 2014, which would suggest returns to the Columbia River should be good for the younger age groups as well.

## 2015 Outlook

The marine environment (Pacific Decadal Oscillation, Sea Surface Temperatures, Southern Oscillation Index, Oceanic Nino Index, and Northern Oscillation Index) show favorable conditions during 2011-2013, with conditions deteriorating during 2014; however, positive indicators outnumber negative indicators. Upwelling has been weak, but food sources seem to be good. Bycatch of eulachon in the ocean shrimp trawl fisheries has been relatively high in the past couple of years, despite improvements made to excluder devices. Age composition may be shifting toward younger age classes. These younger age classes are less impacted by negative indicators, so if this change in composition is true, the prospects for 2015 improve. The mixed forecast leads the Joint Staff to conclude that the 2015 run is likely to be similar to the good runs in the past few years, but not as strong as 2014.

The states have continued discussions with NMFS about reestablishing eulachon fisheries to gather adult biological samples needed to parameterize the SSB estimation model and to gather catch and effort data useful toward monitoring the status of the population. The Columbia River return appears to have improved over the past few years, but other locations within the southern DPS range do not appear to be showing signs of recovery.

## Joint State Eulachon Management Plan

Beginning in 1999, the Washington and Oregon Departments of Fish and Wildlife began work on a Joint State Eulachon Management Plan to guide all aspects of eulachon management for future years. During 1999, WDFW and ODFW developed an interim Eulachon Management Plan to guide fishery management decisions in 2000, because a draft plan had not been completed prior to adoption of recreational and commercial fishing seasons for that year.

In 2001 the WDFW, with input from ODFW, finalized the Washington and Oregon Eulachon Management Plan (WOEMP). The plan contains recommended policies concerning smelt fishery management, which are considered 'wise-use' management precepts consistent with an ecosystem approach in making resource decisions. The ecological importance of eulachon is underscored in much of the body of research in the Northeast Pacific ecosystem, and should be a fundamental consideration when making fishery management decisions affecting the health of this resource.

### *Policy Recommendations for Eulachon Conservation and Fishery Management from the Washington and Oregon Eulachon Management Plan*

#### Conservation Policy

- ✓ Maintain healthy populations of eulachon while assuring the integrity of the ecosystem and habitat upon which they depend.
- ✓ Management actions will consider the role of eulachon in both the marine and freshwater ecosystems and the need to maintain sufficient populations of eulachon for proper ecosystem functioning.
- ✓ A precautionary approach to resource management shall be utilized.
- ✓ Consider the best scientific information available and strive to improve the information base for eulachon.

#### Fishery Management Recommendations

- ✓ Maintain commercial and recreational fishing opportunity in the lower Columbia River, to include opportunities in both mainstem and tributaries for both fleets.

The management plan includes recommendations concerning fisheries occurring in the mainstem Columbia River and its tributaries below Bonneville Dam. Fishery recommendations have been separated into three separate levels, depending on run size expectations based on (1) parental run strength as indexed by fishery landings, (2) juvenile production as indicated by larval sampling, and (3) estimates of ocean productivity. Columbia River smelt fishing seasons were regulated in accordance with the WOEMP from 2001 through March 2010 prior to closure of all Columbia River smelt fisheries.

## **Smelt Fisheries**

Smelt fisheries historically occurred in the mainstem Columbia River and several tributaries, primarily the Cowlitz River. Mainstem fisheries consisted primarily of a commercial fishery using gillnets with some commercial fishers using small trawls. Recreational fishing was also open in the mainstem Columbia River; however there was very little interest in this fishery. Tributary fisheries include recreational and commercial seasons with the Cowlitz River providing the most consistent fishing opportunities. Both fisheries used dip nets to capture smelt, with most recreational fisheries being bank fisheries and most commercial fisheries occurring by boat. Minimal tribal harvest may occur for ceremonial and subsistence purposes. In most years the Yakama Nation, in coordination with WDFW, harvested smelt from the Cowlitz River. In the last few years, the Cowlitz Tribe has also taken smelt from the Cowlitz River for ceremonial and subsistence purposes. In 2013 the Warm Springs Tribe harvested smelt from the Cowlitz River for subsistence purposes.

### **Past Commercial and Recreational Fisheries**

During 1960-1977, commercial smelt fisheries were open year-round 3½ days per week, except for 1965 and 1966 when the season was expanded to 4½ days per week. During 1978-1994, the commercial season was expanded to seven days per week but the season was reduced to the December-March time frame beginning in 1986 to better reflect the run timing of Columbia River eulachon (Table 21). Large trawl gear was also prohibited in 1986. Tributaries in Washington State were closed to commercial fishing during the 1999-2000 seasons. Starting in 2001, some tributary commercial fisheries were reopened and managed according to the WOEMP (Table 22).

As Columbia River eulachon abundance began to decline during the early 1990's, fishery managers recognized the need to restrict fisheries to increase escapement to spawning areas. Columbia River mainstem and tributary commercial fisheries were greatly reduced beginning in 1995 in response to exceptionally poor landings in 1993 and 1994 (Table 23). During 1995 and 1996, commercial fisheries were restricted to fewer fishing days per week, but the season was extended through the end of March. During 1997-2000, commercial fisheries were further restricted to test fisheries with limited days per week and a short season. These test fisheries were intended to allow minimal eulachon catch and collection of biological data to provide fishery managers with data necessary to assess the annual run strength.

The recreational eulachon fishery was a longstanding fishery that occurred in tributaries using dip net gear. Prior to 1997, the recreational fishery in Washington tributaries was open seven days per week the entire year (Table 23). Recreational fisheries in Washington tributaries were closed early during 1997-1999 in response to continuing poor eulachon returns to the Columbia

River. Smelt dippers in Washington were allowed 20 pounds per person each day, except from 2005 through 2010 when the limit was ten pounds per person. No seasons were conducted in 2010-13. In Oregon, the daily limit was 25 pounds per person with the season open throughout the year, although the Sandy River is the only Oregon tributary known to have substantial, albeit highly sporadic, eulachon returns. The recreational dip net fishery was very popular especially in the tributaries, drawing thousands of participants. Eulachon are used for human consumption and are also in great demand for sturgeon bait. Annual recreational catch estimates are not available; however, limited past creel census information suggests that the recreational catch equaled commercial tributary landings when eulachon were abundant for a long period of time.

In response to the ESA listing, the states took precautionary action and prohibited commercial sales from Columbia River and tributary fisheries effective December 10, 2010, and closed all recreational eulachon fisheries effective January 1, 2011. Historically, fishery managers relied on “fishery-dependent” assessments comprised of commercial fishery landings and pounds per landing data as an indicator for run strength. This data also helped managers identify population trends. This long-term set of data ended in 2011 with the discontinuation of Columbia River and tributary fisheries. The states have since been coordinating with NMFS to reinstate research-based eulachon fisheries. Limited conservation-level fisheries provide the opportunity to collect fishery landing and pounds per landing (CPUE) data so the status and run strength of the Columbia River eulachon can be better assessed. Similar information was used in the decision to list eulachon under the ESA.

#### **2014 Commercial and Recreational Fisheries**

In 2014 after working closely with NMFS, The Columbia River Compact adopted both commercial and recreational smelt seasons. These seasons were research-based and provided the opportunity to collect biological data to develop a better understanding of the structure of the Columbia River sub-population. Fishery assessment data allows for a better understanding and calibration of the SSB estimation calculations and help state agencies provide NMFS with improved data for a viability assessment as part of a eulachon recovery plan.

Although the early indicators for the 2014 smelt return allowed for Level-2 fisheries under the WOEMP, Washington and Oregon staff proposed (and the Compact adopted) a season structure that was more conservative than past Level One fisheries in order to emphasize a conservative approach to management in 2014.

Commercial mainstem fishing periods in 2014 consisted of two 7-hour periods per week in Zones 1-3 during February 10 and March 6. No commercial tributary seasons were set in 2014. Commercial landings totaled nearly 19,000 pounds, with the majority of the landings occurring during the two periods in the last week of February.

Recreational fisheries were conducted in two tributaries in 2014; no mainstem seasons were set. The Cowlitz River was open for 6-hrs on Saturdays between February 8 to March 1. The Sandy River was open for 6-hrs on Saturdays between March 1 and March 22. Both tributaries had a daily limit of 10-pounds per person. The fishery was very popular and daily limits were quickly met on about half of the open days. Catch exceeded expectations, due in part to the large smelt return. Catch estimates from the recreational tributary fisheries include 197,900 pounds from the Cowlitz River and 6,000 pounds from the Sandy River.

**Table 1. Estimated and Projected Abundance of 42-60 Inch Total Length (38-54 Inch Fork Length) White Sturgeon in the Lower Columbia River, 1987-2014.**

Year	42-60 TL (38-54 FL)

2015 <sup>4</sup>					138,200

1. Projected abundance based on the previous year's setline estimate.
2. Abundance estimates were not developed in 1994 because insufficient numbers of fish were tagged and in 2004 due to data collection and modeling concerns.
3. The historic approach involves sampling kept catch for tags during the 16 months following tagging. Retention prohibitions in effect since January 1, 2014 preclude estimates for 2013 and 2014.
4. The 2014 setline-based estimate and 2015 setline-based projection are preliminary.

2010	3,529	735	2,794	2,865	98%
2011	2,690	520	2,170	2,030	107%
2012	1,535	520	1,015	1,248	81%
2013	1,410	520	890	1,213	73%
2014 <sup>4</sup>	0	0	0	0	NA

1. Harvest estimates revised November 2011 based on updated punch card and existing creel information.
2. Baseline harvest levels for the lower Willamette River were based on average harvest during 1986-1996 (1,225 fish). The lower Willamette River baseline decreased to 735 fish in 2010 and 520 fish in 2011.
3. During 2003-2009, harvest in excess of the baseline was applied to the above Wauna recreational harvest guideline. Beginning in 2010, a separate harvest guideline was established for the lower Willamette River.
4. No sturgeon retention during 2014.

2014 <sup>4</sup>	0	0	0	0	0	0

1. Actual guidelines used in-season may have been different than shown here.

2. Includes estimated Willamette River recreational harvest in excess of the adjusted 1986-1996 baseline harvest.

3. Preliminary.

4. No sturgeon retention during 2014.

**Table 6. Summary of Mainstem Commercial Seasons and Sturgeon Regulations in the Lower Columbia River, 1997-2014.**

<b>Winter</b>
1997-2002: Two 30-hr fishing periods per week from the 2 <sup>nd</sup> week of January through mid-February (Zones 1-5).
2003: Three 30-hour fishing periods (one per week) followed by one 12-hour period. January only (Zones 1-5).
2004: Five 24-hour fishing periods from mid-January through mid-February (Zones 1-5).
2005: Seven 24-hour fishing periods from January through late February (Zones 1-5).
2006: Ten fishing periods from January-February (Zones 1-5). Seven were 24 hours and three were 12 hours.
2007: Nine fishing periods from January-February. Seven were 24 hours and two were 18 hours (Zones 1-5).
2008: Eleven fishing periods from January - February. Six were 24 hours and five were 18 hours. Three openers were restricted to portions of Zones 4-5 and the remainder occurred in Zones 1-5.
2009: Eight fishing periods from January – February (Zones 1-5). Six were 24 hours and 2 were 18 hours. Landing limit of 12 during the last 4 periods.
2010: Five 24-hour fishing periods during January-February (Zones 1-5) with a 15 fish landing limit in effect. Sturgeon catch also occurs in spring Chinook fisheries. Annual protocol adopted for the Winter/Spring season typically includes 200 sturgeon be set aside for Chinook-directed fisheries. Catches of sturgeon in these fisheries is typically low; therefore, weekly landing limits for sturgeon are generally not utilized in winter/spring salmon-directed fisheries.
2011: Four 24-hour fishing periods took place in late-January to early-February (Zones 1-5) with a 10 white sturgeon/vessel/week landing limit in effect. Some sturgeon harvest also occurs during the spring Chinook fishery. Protocol adopted for the winter/spring timeframe was 800 total (400 for set aside for winter sturgeon, and 400 for winter/spring salmon). Catches of sturgeon in winter/spring salmon directed fisheries is typically low; therefore, weekly landing limits for sturgeon are generally not utilized.
2012: Three 24-hour fishing periods took place during January 30-February 7 in Zones 1-5 with a 10 white sturgeon/vessel/week landing limit in effect. Some sturgeon harvest also occurs during the spring Chinook fishery; there were two fishing periods in early April (April 3 & 10) with six white sturgeon/vessel/week allowed.
2013: Three 24-hour fishing periods took place during January 31-February 7 in Zone 1-5 with a 10 white sturgeon/vessel/week landing limit in effect. Some sturgeon harvest also occurs during the spring Chinook fishery; there was one 9-hour fishing period on April 9 <sup>th</sup> in Zones 1-5 with no landing limit for white sturgeon, and three fishing periods during May in Zones 1-5 with landing limits (May 15, 14-hours with a <b>five</b> white sturgeon/vessel/weekly limit; May 22-23, a 12-hour fishing period also with a <b>five</b> white sturgeon/vessel/weekly limit, and May 29-30, a 12 hour fishing period with a <b>three</b> white sturgeon/vessel/weekly limit).
2014: No winter sturgeon seasons. Sturgeon retention was not allowed during 2014.
<b>Summer</b>
2004: Two 12-hour fishing periods during late June and early July targeting sockeye and summer Chinook.
2005: Six 10-hour fishing periods during late June through late July targeting summer Chinook.
2006: Three 10-hour and ten 12-hour fishing periods from late June through July 31 targeting summer Chinook. Retention of green sturgeon in commercial fisheries was prohibited effective July 6, 2006.
2007: Two 10-hour fishing periods in late June and early July targeting summer Chinook. Weekly limit 5 white sturgeon per vessel.
2008: Three 10-hour fishing periods in late June and early July targeting summer Chinook. A 6-hour target sockeye fishery also occurred in Area 2S on June 30, 2008. Weekly limit 5 white sturgeon per vessel.
2009: One 12-hour fishing period on June 18 and two 10-hour fishing periods on June 24 and 30 targeting summer Chinook. Weekly limit 5 white sturgeon per vessel.

**Table 6. Summary of Mainstem Commercial Seasons and Sturgeon Regulations in the Lower Columbia River, 1997-2014, continued.**

2010: Two 10-hour fishing periods on June 17 and 22 targeting summer Chinook. Weekly limit of 3 white sturgeon per vessel.

2011: Two 8-hour fishing periods, one on June 16-17 and another on June 22 -23. The weekly limit was 5 white sturgeon per vessel.

2012: One 8-hour fishing period took place on June 17-18. The weekly limit was 5 white sturgeon per vessel.

2013: Two 8-hour fishing periods took place on June 16-17, and July 15-16. The weekly limit was **five** white sturgeon per vessel during the first fishing period, and **two** white sturgeon per vessel during the second period.

2014: No sturgeon retention during 2014.

**Early August**

1998-2001: One 12-hour fishing period below Longview Bridge targeting sturgeon during the 1<sup>st</sup> week of August.

2002: Three fishing periods with a five white sturgeon per vessel per day limit. Possession and sales prohibited during the final two fishing periods.

2003-2005: Four 12-hour Chinook fishing periods each year in Zones 1-5.

2006: Six fishing periods in all or portions of Zones 1-5. Weekly landing limits ranged from five to seven white sturgeon per vessel.

2007: Three early August periods of 12 hours each in Zones 1-5. Weekly landing limits = 12 white sturgeon per vessel.

2008: Five fishing periods (four in Zones 1-5 and one in Zones 2-5). Weekly landing limits = 10 white sturgeon per vessel per week.

2009: Three 12-hour fishing periods (two in Zones 1-5 and one in Zones 2-5).

2010: Four 12-hour fishing periods (three in Zones 1-5 and one in Zones 2-5).

2011: One 9-hour fishing period in Zones 1-5 with a weekly landing limit of 10 white sturgeon per vessel.

2012: One 9-hour fishing period in Zones 1-5 (August 5-6) with a weekly landing limit of seven white sturgeon per vessel.

2013: There were no early-August seasons in Zones 1-5 during 2013.

2014: No sturgeon retention during 2014.

**Late August**

1997-2003: Target Chinook seasons in Area 2S or expanded Area 2S during late August.

2004-2005: Four fishing periods during mid to late-August with varying area and possession limit restrictions.

2006: One fishing period in Zones 3-5 and one in Zones 4-5 (upstream of the I-205 Bridge), with a weekly landing limit of seven white sturgeon.

2007: One 11-hour fishery in Zones 4-5 with a three white sturgeon per vessel weekly landing limit.

2008: Two fishing periods in Zones 4-5, with a weekly landing limit of three white sturgeon.

2009: Two 10-hour fishing periods in Zones 3-5 (upstream of Kalama River) with a weekly landing limit of nine white sturgeon and one 10-hour period in Zone 5 only with a weekly landing limit of three white sturgeon.

2010: One 10-hour and two 9-hour fishing periods in Zones 4-5, with a weekly landing limit of four white sturgeon.

2011: Seven 9-hour fishing periods in Zones 4-5 with weekly landing limits of 10 white sturgeon per vessel.

**Table 6. Summary of Mainstem Commercial Seasons and Sturgeon Regulations in the Lower Columbia River, 1997-2014, continued.**

2012: Eight 9-hour fishing periods in Zones 4-5 with weekly landing limits: of three white sturgeon per vessel during August 12 through August 24; and five white sturgeon per vessel during August 26 through August 29.

2013: Eight 9-hour fishing periods in Zones 4-5 with weekly landing limits of **four** white sturgeon per vessel during August 11 through August 29.

2014: No sturgeon retention during 2014.

**Late Fall**

Fisheries occur during mid-September through the end of October and include both salmon- and sturgeon-directed fisheries. Salmon seasons vary depending on run sizes and available impacts for listed species. Target Chinook and/or coho fisheries occur throughout the late fall timeframe while target sturgeon seasons most often occur during October, if sturgeon remain available on the quota.

1997-2000: Target fall sturgeon seasons occurred.

2001: Sturgeon sales prohibited in late-fall due to high landings earlier in the year.

2002: A five white sturgeon per day per vessel possession and sales limit was in effect for nearly the entire late fall season except for the final 3-day fishing period when sturgeon possession and sales were prohibited.

2003: Sturgeon possession and sales limits ranged from three to nine per vessel per week.

2004: Sturgeon possession and sales limit of five white sturgeon per vessel per week was in place for most of the late fall period, but was increased to ten fish during the final three fishing periods.

2005: Sturgeon possession and sales limits ranged from three to 15 fish per vessel.

2006: White sturgeon possession and sales limits were maintained at eight white sturgeon per week per vessel when retention was allowed.

2007: White sturgeon possession and sales limits ranged from 7-12 white sturgeon per vessel through October 5 after which white sturgeon sales in the mainstem were prohibited.

2008: Most fishing periods occurred in Zones 4-5, however, some fishing did occur in all or portions of Zones 1-3. Sturgeon sales were allowed in all periods, with weekly landing limits of 10 fish per vessel through October 3, followed by three fish landing limits thereafter.

2009: Most fishing periods occurred in Zones 4-5, however, some fishing did occur in all or portions of Zones 1-3. Sturgeon sales were allowed through October 23, with weekly landing limits ranging from 5-8 fish per vessel. Sales were prohibited after October 23.

2010: Eleven fishing periods during September 22-October 22 with weekly landing limits of 5-8 fish per vessel.

2011: Ten fishing periods during September 18 – October 20 with weekly landing limits of 2 -7 white sturgeon per vessel.

2012: Sturgeon retention allowed in five (September 19-28 and October 4-5) of 15 late fall fishing periods. The landing limit for the first four fishing periods (three in Zones 4 – 5, and the fourth in Zones 1 – 5) was five white sturgeon per vessel. On October 4 – 5, (one period in Zones 1 – 5), the vessel limit was two white sturgeon.

2013: Sturgeon retention was allowed for the first seven of 34 late fall fishing periods (during September 15-30). The landing limit was **two** white sturgeon per vessel during each week sturgeon were allowed. Sturgeon retention was not allowed from October 1-November 1.

2014: No sturgeon retention during 2014.

1. All non-Indian commercial fisheries downstream of Bonneville Dam were closed to the retention of white sturgeon during 2014 based on OFWC and WFWC action.  
 2. The retention of green sturgeon has been prohibited since July 6, 2006 (NMFS listed the Southern DPS as threatened on April 7, 2006 which became effective July 6, 2006).  
 3. The possession and sales of chum salmon was prohibited by Compact Act on September 26, 2013 for non-treaty commercial fisheries beginning in October, 2013.

1999	"	"	"	Harvest guideline adjusted to 50,000 in-season (40,000 sport). U.S. Army Corps implements Bonneville Boat Restricted Zone from Robins Is. to Hamilton Is. boat ramp.
2000	"	"	"	Retention disallowed below Wauna powerlines April 1-30. Beacon Rock-Bonneville boat angling closure extended through 7/15. Annual limit 10 fish even if licensed in both states.
2001	"	"	"	LCR closed to retention August 1-September 30.
2002	"	"	"	LCR closed to retention on Sundays and Mondays during March 3-May 13 and seven days per week during July 25-November 22.
2003	"	"	"	32,000 annual harvest guideline split 40% above Wauna and 60% below Wauna. Retention allowed above Wauna January 1-March 23 and July 1-October 31 and below Wauna January 1-June 27.
2004	"	5	42" min.-60" max. 45" min. below Wauna during May 15-July 3	28,800 annual harvest guideline split 12,800 above Wauna and 16,000 below Wauna. Retention allowed above Wauna January 1-31, then three days per week (Thur.-Sat.) during February 1-July 31 and October 1-December 31. Retention allowed below Wauna January 1-April 30 under permanent rules, then May 15-July 3 with a 45" minimum size limit. Closed to boat and bank angling from Beacon Rock to Bonneville Dam May 1-July 31. Annual limit reduced to five sturgeon.

**Table 8. History of Sturgeon Regulations for the Lower Columbia River Recreational Fishery, continued**

Year	Daily Bag Limit	Annual Bag Limit	Size Restrictions	Other Regulations
2005	"	"	42" min.-60" max. 45" min. below Wauna during May 14-July 10- and July 15-August 15	29,343 annual harvest guideline split 11,560 above Wauna and 17,783 below Wauna. Retention allowed above Wauna three days per week (Thur.-Sat.) January 1-July 31 and October 1-December 31. Retention allowed below Wauna January 1-April 30 under permanent rules, then May 14-July 10 and July 15-August 15 with a 45" minimum size limit.
2006	"	"	42" min.-60" max. 45" min. below Wauna during May 13-July 4	28,800 annual harvest guideline split 12,800 above Wauna and 16,000 below Wauna. Retention allowed above Wauna three days per week (Thur.-Sat.) during January 1-July 31 and October 1-December 31. Retention allowed below Wauna January 1-April 30 under permanent rules, then May 13-July 4 with a 45" minimum size limit. Closed to boat and bank angling from Navigation Marker 85 to Bonneville Dam May 1-July 31.
2007	"	"	42" min.-60" max. 45" min. below Wauna during May 12-July 4	30,126 harvest guideline split 13,852 above Wauna and 16,274 below Wauna. Retention allowed above Wauna three days per week (Thur.-Sat.) January 1-31 and four days per week (Thur.-Sun.) February 1-July 31 and seven days per week August 18-December 31. Sturgeon retention allowed below Wauna January 1-April 30 under permanent rules then May 12-July 4 with a 45" minimum size limit. Retention of green sturgeon prohibited.
2008	"	"	42" min.-60" max. 45" min. below Wauna during May 10-July 26	25,530 harvest guideline split 12,387 above Wauna and 13,143 below Wauna. Retention allowed above Wauna four days per week (Thur.-Sun.) January 1-December 31. Sturgeon retention allowed below Wauna January 1-April 30 under permanent rules then May 10-June 24, July 10-12, July 17-19, and July 26 with a 45" minimum size limit.
2009	"	"	38" min. FL - 54" max. FL 41" min. FL below Wauna May 9-July 25.	Fork length measurement. 26,959 harvest guideline split 11,430 above Wauna and 15,529 below Wauna. Retention allowed above Wauna three days per week (Thur.-Sat.) January 1-July 31 and October 1-December 31. Retention allowed below Wauna January 1-April 30 under permanent rules, then May 9-June 28, July 2-5, 10-12, 17-19 and 24-26 with a 41" minimum size (FL) limit.
2010	"	"	38" min. FL - 54" max. FL 41" min. FL below Wauna May 22-August 1.	17,300 annual harvest guideline split 7,700 above Wauna (including a sub-allocation for the Willamette River of 2,865) and 9,600 for the estuary. Retention allowed above Wauna three days per week (Thur.-Sat.) January 1-July 31 and October 1-December 31, except closed inside Sand Island (near Rooster Rock) April 29-July 31. Closed to all sturgeon angling during May 1-August 31 from Skamania Island upstream to Bonneville Dam. Retention allowed below Wauna January 1-April 30 under permanent rules, then May 22-July 11 and July 15-August 1 with a 41" minimum size (FL) limit.

**Table 8. History of Sturgeon Regulations for the Lower Columbia River Recreational Fishery, continued**

Year	Daily Bag Limit	Annual Bag Limit	Size Restrictions	Other Regulations
2011	1	5	38" min. FL – 54" max. FL 41" min. FL below Wauna May 14-July 31.	12,240 annual harvest guideline split 5,440 above Wauna (including a sub-allocation for the Willamette River of 2,030) and 6,800 for the estuary. Retention allowed above Wauna three days per week (Thur.-Sat.) January 1-July 31 and October 1-December 31, except closed inside Sand Island (near Rooster Rock) January 1-April 30. Retention allowed below Wauna January 1-April 30 under permanent rules, then May 14-July 31 with a 41" minimum size (FL) limit.
2012	"	"	38" min. FL – 54" max. FL 41" min. FL below Wauna May 12-July 4.	7,488 annual harvest guideline split 3,328 above Wauna (including a sub-allocation of 1,248 for the Willamette), and 4,160 for the estuary. Retention allowed above Wauna three days per week (Thur.-Sat.) January 1-July 31, except closed inside Sand Island (near Rooster Rock) February 1-April 30. Retention allowed below Wauna January 1-April 30 under permanent rules, then May 12-July 4 with a 41" minimum size (FL) limit.
2013	"	2	38" min. FL – 54" max. FL 41" min. FL below Wauna May 11-June 20.	7,276 annual harvest guideline split 3,234 above Wauna (including a sub-allocation of 1,213 for the Willamette), and 4,042 for the estuary. Retention allowed above Wauna three days per week (Thur.-Sat.) January 1-June 15, except closed inside Sand Island (near Rooster Rock) January 1-April 30. Retention allowed below Wauna January 1-April 30 under permanent rules, then May 11-June 20 with a 41" minimum size (FL) limit.
2014	0	0	No retention.	Catch and release only. Sand Island Slough and Bonneville Dam sanctuaries in effect per permanent regulations.

1. Individual columns may not add up to total column due to rounding errors. Recreational harvest in the Willamette River is not included.
2. White sturgeon legal size limits were 36"-72" during 1977-1988, 40"-72" during 1989-1993, 42"-66" during 1994-1996, and 42"-60" thereafter.
3. White sturgeon legal size limits were 48"-72" during 1977-92, 48"-66" during 1993-96, and 48"-60" thereafter.
4. Commercial data is preliminary.
5. Converted from current regulation fork length measurements to total length equivalent measurements.
6. Preliminary data.
7. No sturgeon retention during 2014.

1. CPUE = pounds per delivery. These statistical weeks typically represent the first eight calendar weeks of the year (about January 1 through February 15).
2. Season total catch may include catch during the previous December.
3. Commercial fisheries closed effective December 1, 2010, due to ESA status.
4. Minor research fishery conducted in 2014.

1. Inter-annual comparisons of abundance are tentative as sampling has not been systematic from year to year. Mainstem Columbia R. data since 2003 includes multiple collections at Price Island and Clifton Channel sites.
2. N/S = not sampled. N/C = larval density not calculated, but some larvae collected.
3. Average density observed by the Cowlitz Tribe Fish and Wildlife staff was 28 larvae per cubic meter.

1. The Age 2 estimate may also include some Age 3 fish.
2. The estimates of number of fish by age are not official Canadian Department of Fisheries and Ocean values.
3. The detailed length data is based on interpretation of 2006-2012 WCVI Eulachon Length Frequency graphs at: [http://www.pac.dfo-mpo.gc.ca/sci/herring/herspawn/pages/ocean1\\_e.htm](http://www.pac.dfo-mpo.gc.ca/sci/herring/herspawn/pages/ocean1_e.htm)
4. The Canadian Department of Fisheries and Oceans ceased to enumerating bycatch of eulachon in 2013, but do continue to provide length frequency graphs for the eulachon sampled.

1. Fishery levels are described in the Joint State Eulachon Management Plan.
2. Also, a second reduced test fishery (1-3 boats with state observers onboard) occurred on January 31, February 7, and February 18, 1999 during daylight hours.
3. Under permanent rules (prior to December 2010), December 1-31 was open 7 days/week, 24 hours.
4. Commercial fisheries were closed effective December 1, 2010, due to ESA listing.
5. Minor research fishery conducted.

1. The table contains the emergency regulations that modify the seasons during the January 1 – March 31 period. Washington tributaries not mentioned above were closed by emergency regulation during this period. All tributary commercial fisheries are restricted to dip net gear.
2. Area restricted to downstream of Peterson’s Eddy (approximately River Mile [RM] 8.0).
3. Area restricted to downstream of Modrow Bridge (RM 2.9).
4. Area restricted to the mainstem and north fork downstream from the overhead powerlines near Eagle Island (approximately RM 11.5).
5. Oregon tributaries (e.g., Sandy River) are open 24 hours per day, 7-days/week, all year.
6. Tributary commercial fisheries were closed effective December 2010 due to ESA listing.

**Table 23. Lower Columbia River Basin Recreational Smelt Seasons, 2002-2014**

2002	The Columbia River and Oregon tributaries open 7 days per week the entire year. Washington tributaries open Saturdays, Sundays, and Wednesday from 6 AM to 10 PM during January 1-February 25, 2002. Washington tributaries open 7 days per week from 6 AM to 10 PM during February 26-March 31, 2002.
2003	The Columbia River and Oregon tributaries open 7 days per week the entire year. Washington tributaries open 7 days per week from 6 AM to 10 PM during January 1-March 31, 2003.
2004	The Oregon portion of the Columbia River and Oregon tributaries open seven days per week the entire year (25-lbs. daily limit), and the Washington portion of the Columbia River was open 7 days per week during January 1- March 31, 2004 (20-lbs. daily limit). Washington tributaries were open 7 days per week from 6 AM to 10 PM during January 1 – March 19, 2004, and on Wednesdays and Saturdays from 6 AM to 10 PM during March 19-31, 2004 (20-lbs. daily limit).
2005	The Oregon portion of the Columbia River and Oregon tributaries open seven days per week the entire year (25-lbs. daily limit), and the Washington portion of the Columbia River was open 7 days per week during January 1- March 31, 2005 (25-lbs. daily limit). Washington tributaries (Grays River, Cowlitz River, Kalama River, and Lewis River) were open on Tuesdays and Saturdays from 6 AM to 10 PM during January 1 – February 23, 2005 (10-lbs. daily limit), and in the Cowlitz River only, on Saturdays from 6 AM to 10 PM during February 26 – March 31, 2005 (10-lbs. daily limit).
2006-2007	The Oregon portion of the Columbia River and Oregon tributaries open seven days per week the entire year (25-lbs. daily limit), and the Washington portion of the Columbia River was open 7 days per week during January 1- March 31 (25-lbs. daily limit). Washington tributaries were closed with the exception of the Cowlitz River, which was open on Saturdays only, from 6 AM to 10 PM, during January 1 – March 31 (10-lbs. daily limit).
2007-2009	The Oregon portion of the Columbia River and Oregon tributaries open seven days per week the entire year (25-lbs. daily limit), and the Washington portion of the Columbia River was open 7 days per week during January 1- March 31 (25-lbs. daily limit). Washington tributaries were closed with the exception of the Cowlitz River, which was open on Saturdays only, from 6 AM to 10 PM, during January 1 – March 31 (10-lbs. daily limit).
2009-2010 <sup>1</sup>	The Oregon portion of the Columbia River and Oregon tributaries open seven days per week the entire year (10-lbs. daily limit), and the Washington portion of the Columbia River was open 7 days per week during January 1-March 31 (10-lbs. daily limit). Washington tributaries were closed with the exception of the Cowlitz River, which was open on Saturdays only from 7 AM to 3 PM, during February (10-lbs. daily limit).
2011-2013	Closed
2014 <sup>2</sup>	Columbia River closed. All tributaries closed except the Cowlitz River on the Washington shore, which was open on Saturdays (6 AM-noon) during February 8 - March 8 (10-lbs. daily limit) and the Sandy River on the Oregon shore, which was open on Saturdays (6 AM-noon) during March 1-22 (10-lbs. daily limit).

1. Recreational fisheries were closed effective December 2010 due to ESA listing.

2. Minor research fishery.
