The logo is a circular emblem containing a stylized landscape. At the top, there are three evergreen trees. Below them is a mountain range. In the center, a fish is shown swimming in a body of water. At the bottom, a crab is depicted. The entire scene is rendered in a monochromatic, high-contrast style.

Hatchery Escapement Report

This report is published annually by the **Washington Department of Fish and Wildlife (WDFW) Fish Program/ Hatcheries Division**. It is generated directly from the WDFW Adult Report Database. This database contains daily records of adult fish handling activities as reported by hatchery facilities on the Adult Record Form. It describes the total escapement or return of species of salmon and trout to WDFW and cooperative projects within Washington state. It enumerates the total number of fish returning to hatchery racks or traps in the rivers and streams of Washington state for the spawning activity cycle beginning in approximately March 2000 and ending in approximately March 2001.* We define escapement as the return of spawning fish to hatchery racks or traps. The data for this report is developed by WDFW hatchery staff and Olympia hatchery division staff who enumerate the runs of fish returning to their respective natal streams; these numbers are transferred to adult records which are sent to Olympia for compilation and analysis. These records provide information on run timing for statewide runs of fish; information on the results of selective fisheries, and critical data for coded wire tag (CWT) analysis. CWTs are a management tool used to determine the status of runs and the effect of various management strategies and research projects. (These CWT recovery totals are available at www.rmis.org). This report represents the collective work of many people and as such captures the definitive data for that spawning cycle providing a summary of salmonids returning to WDFW facilities throughout the state of Washington and the eggs that were spawned in association with those returning fish. For example: the 2000-2001 return year produced 646,441 adult fish returning to hatchery racks and traps and 214,488,683 eggs were collected.

This **annual hatchery escapement report** is organized and divided into three geographical regions: **Puget Sound**(including the Straits of Juan de Fuca), **Coast**, and **Columbia River**. It is further divided by species and races. For example: chinook salmon are described in three geographic regions, Puget Sound(including the Straits of Juan de Fuca), Coastal, and Columbia River, as well as by their fall, spring, and summer races.

Definitions

Some column heading definitions and other word definitions are provided to aid understanding of this document. The **facility** name column describes the location where fish were trapped. Because this report was generated directly from the Adult Record Database, many facility names are abbreviated to match the standard names used for data sharing through the Pacific Salmon Commission. The **stock** column represents the known origin of the fish returning to that river or stream. The **Bo**, or brood origin column represents the origin of the fish as to whether they are hatchery origin (**H**) stock, wild origin (**W**) stock, or mixed origin (**M**) stock of hatchery and wild fish. The **Total Trapped Adults** column enumerates full-sized sexually mature fish returning to spawn in their home streams or rivers. The **Total Trapped Jacks** column enumerates sexually mature male fish that return at a very small size to their home streams or rivers. Coho and chinook salmon produce the largest numbers of jacks. The **Total Trapped** column represents

the total number of fish trapped at the hatchery rack. It may not represent the total run to any given river due to presence of either wild, hatchery, or mixed stocks that may spawn below the hatchery rack or may die or be harvested below the hatchery via sport, commercial, or tribal fisheries. This column also does not include fish that pass the trap/rack when it is not in use such as a temporary weir or a fish collection facility that is only used intermittently. **Eggtake goals** were taken from the 2000 Future Brood Document and represent the pre-season eggtake goals. The goals may have changed in-season due to unforeseen factors, meaning that actual eggtakes may have differed from the listed goals. **NA** for eggtake goal means there was no eggtake goal. The **Released to stream** column records the numbers of fish returned to the stream above or below the hatchery rack or trap that were not spawned. The **Trapped less released** column equals the number of fish that were spawned, died, transferred out, or distributed minus the fish passed upstream. **Race** is defined as broad groupings of hatchery stock fish species representing distinct adult timing or juvenile migration patterns. Wild stock timings may differ according to location and the stock of fish. **NA** for race refers means that we do not identify a timing difference. Example: Most Puget Sound region coho and chum salmon stocks are **NA**. **Type N** refers to Columbia River region juvenile coho that turn north (N) as they leave the Columbia River and return later than normal as adult fish. **Type S** refers to Columbia River juvenile coho that turn south(S) as they leave the Columbia River and return earlier than normal as adult fish. **Sea-run** refers to coastal cutthroat that spend a portion of their life in saltwater. **Westslope** generally refers to resident cutthroat originating from the drainages of the **westslope** of the Rocky Mountains. **Westslope** is used here to refer to resident cutthroat from the Yakima River upstream in the Columbia drainage. **Fall** refers to adults that return to spawn primarily in the fall months of the year although this timing varies between chinook and chum salmon. **Spring** refers to adults that return their home streams in the spring months of the year and spawn primarily in the late summer to early fall months of the year. For steelhead, **summer** refers to adults that return from July to September and spawn from December to January; for chinook **summer** refers to adults that arrive from July through August and are spawned in October through the early part of November, and for chum **summer** refers to adults that return in August to mid-September and are spawned from August to mid-September. **Winter** refers to adults that return from mid-November to the end of January and spawn from December to January. **Winter-Late** refers to a specific stock of Cowlitz river wild winter steelhead with a later than normal timing that is being restored.

* This report does not include the **captive brood programs** which will be released in a separate report.

Hatchery Anadromous Fish Escapement Summary
