BE AWARE OF FIRE CONDITIONS

Wherever you choose to hunt, be sure to check on fire conditions, access restrictions, and other emergency rules before you head out. In addition to wildfires, the U.S. Forest Service (USFS) and Washington Department of Fish and Wildlife (WDFW) may be conducting prescribed burns and/or forest-thinning projects in your hunt area. For more information, see:

- Wildfire status updates (InciWeb – Incident Information System)
- Northwest Interagency Coordination Center
- WDFW Wildlife Areas

DISTRICT 3 GENERAL OVERVIEW

WDFW’s District 3 is located in southeast Washington and consists of 13 game management units (GMU). GMUs in District 3 include 145 (Mayview), 149 (Prescott), 154 (Blue Creek), 157 (Watershed- Closed entry except by permit), 162 (Dayton), 163 (Marengo), 166 (Tucannon), 169 (Wenaha), 172 (Mountain View), 175 (Lick Creek), 178 (Peola), 181 (Couse), and 186 (Grande Ronde). Administratively, District 3 includes Walla Walla, Columbia, Garfield, and Asotin counties, and is one of three management districts (1, 2, and 3) comprising WDFW’s Region 1. The northern part of District 3 (north of Highway 12) includes the southeastern portion of the Palouse Prairie ecoregion, while the southern part of the district is in the Blue Mountains ecoregion.

Figure 1. GMU map (from GoHunt) depicting District 3 GMU boundaries, west and south of the Snake River, east of the Columbia River, and north of the Oregon border. Green areas are U.S. Forest Service land and blue areas are WDFW Wildlife Areas.
The landscape in District 3 is dominated by agricultural land in the prairie and foothill regions, with interspersed grassland areas and brushy eyebrows and draws. In the mountains, the most common habitat is characterized by second growth forests consisting primarily of Ponderosa pine, Douglas fir, grand fir, and subalpine fir. The Blue Mountains have been characterized as a high plateau dissected by steep draws and canyons carved by numerous creeks and rivers. The Tucannon and Touchet rivers flow north out of the mountains, while forks of the Wenaha River and its major tributaries generally flow south. Numerous creeks drain the western edge of the foothills, including Mill Creek, with its drainage located in the Walla Walla Watershed.

Image 1. Blue Creek in the western foothills of the Blue Mountains.

District 3 is best known for its elk hunting opportunities in the Blue Mountains and mule deer hunting opportunities in grassland/agricultural GMUs. However, quality hunting opportunities also exist for other game species, including white-tailed deer, black bear, turkey, and pheasant. Table 1 presents estimates of harvest and harvest-per-unit effort (HPUE) for most game species in District 3 during the 2018 hunting season, and how those estimates compare to the 2017 season and the five-year average. For more specific information on harvest trends, please refer to the appropriate section in this document.
Table 1. General season harvest and HPUE estimates for most game species found in District 3 during the 2017 and 2018 hunting seasons. Also included are the five-year averages and a comparison of 5-year estimates and 2017 to 2018 estimates. HPUE is expressed as #hunter days/harvest for elk, deer, and bear (lower is better), and as #harvested/hunter day for all other species (higher is better).

**ELK**

**GENERAL INFORMATION, MANAGEMENT GOALS, AND POPULATION STATUS**

In Washington, elk are managed at the herd level, while harvest regulations are set at the GMU level. Population objectives are set at the herd level, and survey data is summarized at that level as well. District 3 is comprised of the single Blue Mountains elk herd (GMUs 145, 149, 154, 157, 162, 163, 166, 169, 172, 175, 178, 181, and 186).
Only the GMUs within the forested portion of District 3 are managed for elk population stability or growth (GMUs 154, 157, 162, 166, 169, 172, 175, and 186). GMUs 145, 149, 163, 178, and 181 are managed to limit elk numbers, although some recreational opportunity is provided as determined through surveys and damage complaints. In all GMUs, minimizing elk depredation to agricultural crops on private agricultural lands is a priority. An additional management objective is to maintain a minimum of 22 bulls: 100 cows in the post-season population, with a range of 22 – 28 bulls:100 cows as the management target.

Biologists in District 3 conduct a biennial helicopter survey within the core elk areas to estimate the post-winter population size. In the spring of 2019, biologists generated a population estimate of 4,115 (90 percent Confidence Interval of +/- 285) elk. Surveys are conducted along the state line of Oregon (and within Oregon), resulting in approximately 500-600 elk being classified that likely are not available for harvest in Washington during the fall. The average five-year population estimate prior to 2019 was 5,259 elk, which is 18 percent higher than the 2019 estimate. The 2019 surveys documented a calf ratio of 23.8 calves per 100 cows and a bull ratio of 23.3 bulls per 100 cows.

Calf ratios increased in 2019 compared to the 2017 survey but are still lower than the 5-year average of 27.8. This low number is attributed mainly to poor overwinter survival due to persistence of deep snow through the winter of 2018/2019, lingering effects of the severe winter in 2016/2017, and predation on calves. The effects of climate on elk productivity is difficult to quantify in years following a severe winter or summer drought. Poor body condition can result in calves with low birth weight and lower survival, or effects can carry-over into the breeding season (summer drought) decreasing pregnancy rates and resulting in fewer pregnancies, all of which may have influenced depressed cow/calf ratios over the past few seasons.

Bull ratios and total bull numbers declined substantially in 2019, which will result in a decreased number of branched-bull permits in years to come. The recent decline in the number of elk in the Blue Mountains is likely a result of multiple factors; such as the hard winters observed in 2016/2017 and 2018/2019, summer droughts, and similar levels of predation over the past 5 to10 years which cumulatively reduced survival of adults and negatively impacted recruitment. The substantial decline in the number of calves making it through the 2016/2017 and 2018/2019 winters resulted in a large decline in the number of yearling bulls (spikes) available for harvest during the following falls, and the likely carry-over effect of low pregnancy success will be another below average year for yearling bull harvest in 2019.

For more detailed information related to the status of Washington’s elk herds, hunters should read through the most recent version of the Game Status and Trend Report, which is available for download on the department’s website.

**WHICH GMU SHOULD ELK HUNTERS HUNT?**

Most general season hunters in the Blue Mountains have been hunting here for many years, with the exception of branched-bull tag holders and archery hunters in GMU 175. New hunters to this area will have to consider a number of options, such as weapon type, private land access versus public land, difficulty of hunt desired (wilderness versus landscapes with roads), and, as archery hunters, whether the availability of antlerless opportunity is important.
Throughout District 3, the harvest of branched-bulls is regulated through the permit system. All GMUs in District 3 are managed for quality hunting, except GMUs 145, 186, and some hunts in 149. The drawing of these tags can be difficult and many hunters invest years before successfully obtaining a permit. Once a permit is obtained, district biologists are happy to provide information on where to hunt within the GMU.

**A BRIEF DESCRIPTION OF EACH GMU**

**GMU 145**
This is a private land unit managed for zero elk. Very few elk reside in this unit. Their movements are unpredictable and make them difficult to locate, and access to their locations is often not readily available.

**GMU 149**
This large GMU is predominantly private land managed to minimize elk numbers because of conflicts with agricultural activities. A relatively large number of bulls inhabit the southwest corner of the GMU and cross back and forth between Oregon and Washington. Most harvest in recent years has occurred in the area of the Boise Cascade poplar tree farm. A major change coming to this unit is the conversion of the tree farm to other agricultural crops. Elk in this area will lose security cover and their movement patterns between Oregon and Washington are likely to change significantly, making elk difficult to locate. For the 2019 hunting season, the Boise Cascade Corporation will not be allowing any hunting access to the tree farm as the conversion takes place from poplar trees to irrigated row crops. An additional herd of elk exists in the northern portion of the unit on the breaks of the Snake River. This is a very difficult herd to hunt without access to numerous private lands, as the elk are highly mobile in this area and can be difficult to locate.

**GMU 154**
This GMU is 99 percent private land, but does include numerous landowners in the WDFW access program. The elk are heavily hunted in this GMU due to conflicts with agricultural activities. Access has historically been available to branched-bull tag holders and general season hunters.

**GMU 157**
This GMU is 99 percent public land, but closed to the public to any entry other than special permit holders. The Mill Creek Watershed is the source of drinking water for the City of Walla Walla, and access is highly regulated. Successful permit applicants will be contacted by the U.S. Forest Service (USFS) with an information packet containing rules for hunting the watershed. This unit is very steep and rugged, contains few maintained trails, and is physically challenging to hunt. No scouting or overnight camping inside the watershed boundaries is permitted. Only the perimeter roads and trails can be accessed for scouting.
**GMU 162**
The Dayton GMU is a mix of private and public lands and has historically supported about 1,000 elk. Currently the number of elk in the Dayton GMU is 20-30 percent below the historic numbers. This unit has the highest density of general season hunters in District 3. Access to the northern portion of the GMU can be difficult, as it is predominantly private. The southern portion of the unit is predominantly USFS and lands owned by the Confederated Tribes of the Umatilla Indian Reservation (CTUIR). Both of these lands are open to the public, with motorized vehicle restrictions throughout.

**GMU 163**
This GMU is not managed for elk and only occasionally supports enough elk to hunt. The GMU is predominantly private land.

**GMU 166**
This GMU has recently had the highest success rate for general season hunters, but also has one of the higher densities of hunters. The unit is predominantly USFS and WDFW-owned lands. A portion of the Wenaha-Tucannon Wilderness extends into this GMU and offers backcountry hunting opportunities.

**GMU 169**
Most of this GMU is located within the Wenaha-Tucannon Wilderness. Numerous road access points occur along the edge of this GMU, but a majority of the unit requires backpacking or horse packing to access. This can be a physically challenging unit to hunt. Elk densities have remained low in this unit for the past 20 years and do not show indications of improving. However, a large wildfire burned in this unit in 2015, which is expected to have a positive effect on elk numbers and habitat quality for years to come.

**GMU 172**
Elk numbers have risen in this GMU recently and can offer good general season opportunity, depending upon access. Approximately 60 percent of this GMU is private and access can be challenging. The USFS lands within this GMU are physically challenging to hunt. WDFW has been acquiring land within this GMU recently (4-0 Ranch Wildlife Area), but deer and elk hunting there is managed by permit only access.

**GMU 175**
This GMU is predominantly public land owned by WDFW, USFS, and Washington DNR. Access is good throughout the unit. One major change as the result of declining elk numbers observed in this unit is the restriction of archery hunters to spike-only, with no antlerless opportunity available for any weapon type without an antlerless permit.

**GMU 178**
This private land unit is managed to minimize elk numbers due to conflict with agricultural activities. Access can be challenging to obtain. Elk numbers are highly variable in the unit and
do not offer reliable recreational opportunity during the general season without knowledge of landowners and herd behavior.

**GMU 181**

This private land unit is managed to minimize elk numbers due to conflict with agricultural activities. Access can be challenging to obtain. Elk numbers are highly variable in the unit and do not offer reliable recreational opportunity during the general season without knowledge of landowners and herd behavior.

**GMU 186**

This unit is split equally between private and public lands, with very limited private land access available. This GMU is predominantly winter range for elk in Oregon, although approximately 100 elk reside in the unit throughout the year. The individual elk may reside on private land throughout the season where access is not available, although some years have proven highly successful for the few hunters that know the unit.

**Summary of GMU Harvest Attributes**

The information provided in Table 2 provides a quick and general assessment of how District 3 GMUs compare with regard to harvest, hunter numbers, and hunter success during general modern firearm, archery, and muzzleloader seasons. The values presented are from the 2017 harvest reports. Total harvest and hunter numbers were further summarized by the number of elk harvested and hunters per square mile.

Each GMU was ranked from one to 10 for elk harvested/mi² (bulls only for modern firearm and cows included with bulls for archery), hunters/mi², and hunter success rates. The three ranking values were then summed to produce a final rank sum, with Public Access ranking excluded. The modern firearm comparisons are the most straightforward because bag limits and seasons are the same in each GMU.

For archery seasons, hunters have to consider that antlerless elk may be harvested in one public land GMU (175) and on private lands throughout multiple GMUs. These differences are important when comparing total harvest or hunter numbers among GMUs. Hunters should keep these differences in mind when comparing and interpreting the information provided in Table 2.

Table 2. Rank sum analysis that provides a quick and general comparison of how total harvest, hunter numbers, and hunter success rates compare among GMUs during general modern firearm, archery, and muzzleloader seasons. GMUs are generally limited to spike bull harvest, but some may have antlerless opportunity as well (see hunting regulations for specific restrictions). Data presented are based on 2018 harvest reports.

WHAT TO EXPECT DURING THE 2019 SEASON

It has been uncommon for elk populations to fluctuate dramatically from year to year, especially in District 3 where severe winter weather conditions seldom occur. Unfortunately, the winters of 2016/2017 and 2018/2019 were uncommonly severe, resulting in a significant decline in elk numbers. Although calf recruitment increased in 2018 over 2017 numbers, recruitment was still
below average and consequently, populations available for harvest are expected to be lower than years prior to the 16/17 winter. A slight improvement over 2018 harvest is expected, but a lower than average number of spike bulls is likely to continue into the 2019 hunting season. Hunter numbers also typically do not change substantially from one year to the next. Weather during hunting season does change from year to year, which will influence success rates.

**HOW TO FIND ELK**

When hunting elk in District 3, hunters need to do their homework and spend plenty of time scouting before the season opener because it is often difficult to predict where the elk are going to be, especially after hunting pressure increases. The majority of hunters spend most of their time focusing on open ridge tops where they can glass animals from a considerable distance. During the general season, past research on bulls has indicated that a majority of the elk will move to north aspect, mid-slope timbered hillsides within one day of the opener. With only nine days to hunt the general season, there is a lot of pressure the first few days. Pressure declines as the season progresses and may allow the elk to return to normal behaviors if they are not close to major roads.

Later in the season, it is a good idea to consult a topographic map and find “benches” located in steep terrain and thick cover because elk often use these areas to bed down during the day. Lastly, on public land, hunters should not let a locked gate keep them from walking into an area to search for elk. More often than not, these areas hold elk that have not received as much hunting pressure.
Figure 2. Trends in total number of yearling bulls (blue), branched bulls (red), and antlerless (purple) elk harvested during general and permit seasons combined, 2008-2017. Harvest does not include tribal harvest.
ELK AREAS

There are nine elk areas in District 3: Elk Area 1008 and 1009 (Wenaha Wilderness West and East), Elk Area 1010 (Dayton private lands), Elk Area 1013 (Mountain View Private), Elk Area 1016 (GMU 162 excluding the Rainwater WLA), Elk Area 1040 (4-0 Wildlife Area), Elk Area 1075 (Lick Creek Private Lands), Elk Area 1081 (GMU 181 + extreme west side of GMU172), and Elk Area 1082 (George Creek Wildlife Area).

The intent of Elk Areas 1008 and 1009 was to distribute the hunting pressure within the Wenaha-Tucannon Wilderness. In the past, most permit hunters focused in the western corner of the unit where the road density was highest. By spreading out the hunting pressure, additional hunting opportunity was created.

Elk Area 1010 is used to focus antlerless and branched-bull elk hunting on private land in the Dayton Unit. In the past, branched bull tag holders focused on public lands where access was guaranteed, but also increased pressure on that segment of the population. This elk area is also used to focus antlerless harvest on the private lands where depredation complaints have historically been high, but limits antlerless harvest on public lands where higher elk densities are desired. Elk Area 1016 is used to provide controlled antlerless elk hunting opportunity on public lands, excluding the Rainwater Wildlife Area (CTUIR).

Elk Areas 1013 and 1040 are used to manage hunters within GMU 172. Elk Area 1013 limits antlerless hunting to private lands where damage can occur on agricultural areas, while maximizing elk numbers and recruitment on public lands. Elk Area 1040 is the newly acquired 4-0 Ranch Wildlife Area, which is managed for quality hunting opportunity as part of the sale agreement from the previous landowner. All deer and elk hunting on this wildlife area will be managed for quality opportunity, whereas all other species may be hunted by general seasons as listed in the pamphlet.

Elk Area 1075 has recently been created to try to use hunters to alter the behavior of elk that leave the Asotin Creek Wildlife Area for private agricultural grounds. To minimize crop damage, hunters are being used to move elk off of private lands in the Lick Creek GMU. The same is true for Elk Area 1081.

Elk Area 1082 is also being used to address elk distribution problems. Recently, a small group of elk has remained on the George Creek Unit of the Asotin Creek Wildlife Area. Hunters will be used to either harvest or pressure these elk onto more desirable public lands.

NOTABLE ISSUES AND HUNTING CHANGES

1. Elk Area 1040 (4-0 Ranch Wildlife Area) is closed to general season deer and elk hunting. Elk hunting will only be allowed through the permit system on these lands.

2. Antlerless elk opportunity was increased in 2014 in GMU 181 due to increasing herd size and depredation complaints, and boundary changes were made to hunts in this area in 2018 to include Elk Area 1075 and 1082 to continue refining our efforts to address
problematic elk distributions. Elk in this unit primarily inhabit private lands and acquiring access prior to applying for permits is highly recommended.

3. During the summer of 2015, a large wildfire burned through a large portion of the Wenaha-Tucannon Wilderness, extending slightly into GMU 172 on Grouse Flats. A large portion of the fire that occurred in Washington burned later into September, creating desirable habitat conditions for elk with low intensity burning.

## DEER

### GENERAL INFORMATION, MANAGEMENT GOALS, AND POPULATION STATUS

Both mule deer and white-tailed deer occur throughout District 3. Deer hunting opportunities in District 3 vary from marginal to quite good, depending on the GMU. The GMUs with highest success (GMUs 145, 178, 181, and 186) also have the highest amount of private land and access can be limited. GMUs where access to public land is highest (GMUs 166, 169, and 175) have the lowest success, probably due to a combination of high hunter numbers, high percentage of legal bucks harvested, and lower quality deer habitat. While overall harvest is one indicator of GMU hunting quality, harvest/unit effort (HPUE) and harvest/unit area (HPUA) equalize GMUs based on hunter numbers, number of days hunting, and GMU size. However, both HPUE and HPUA can be misleading, as HPUE is complicated by private land access limitations and HPUA is complicated by the amount of habitat in the GMU that actually supports deer. In general, HPUE seems to be a better indicator of hunting success. Hunter success and HPUE of either white-tailed or mule deer in District 3 is highest in GMUs 145 (Mayview), 178 (Peola), 181 (Couse), and 186 (Grande Ronde) while total general season harvest is highest in GMUs 149 (Prescott), 154 (Blue Creek), and 162 (Dayton).

Currently, WDFW does not use formal estimates or indices of population size to monitor deer populations in District 3. Instead, trends in harvest, hunter success, and HPUE (harvest/hunter day) are used to monitor population status. WDFW recognizes the limitations of using harvest data to monitor trends in population size and are conducting periodic aerial sightability surveys.
to monitor deer populations that are independent of harvest data and exploring the use of integrated population models.

All available harvest data indicates deer populations appear to be stable in District 3, although 2017 harvest numbers were down significantly following a hard winter. For more detailed information related to the status of mule deer and white-tailed deer in Washington, hunters should read the most recent version of the Game Status and Trend Report, which is available for download on the department’s website.

**WHICH GMU SHOULD DEER HUNTERS HUNT?**

Probably the most frequent question from hunters is, “What GMU should I hunt?” This is not always easy to answer because it depends on the hunting method and the type of hunting experience desired. Some hunters are looking for a quality opportunity to harvest a mature buck, while others just want to harvest any legal deer, and still others prefer to hunt an area with few other hunters.

The ideal GMU for most hunters would have high deer densities, low hunter densities, and high hunter success rates. Unfortunately, this scenario does not exist in any GMU that is open during the general modern firearm, archery, or muzzleloader seasons in District 3. Instead, because of general season opportunities, the GMUs with the highest deer densities tend to have the highest hunter densities as well. For many hunters, high hunter densities are not enough to persuade them not to hunt in a GMU where they see lots of deer. Some hunters prefer to hunt in areas with moderate to low numbers of deer if that means there are also very few hunters and provide a backcountry experience.

The information provided in Table 3 provides a quick and general assessment of how GMUs compare with regard to harvest, hunter numbers, and hunter success during general modern firearm, archery, and muzzleloader deer seasons. The values presented are the five-year averages for each statistic. Total harvest and hunter numbers were further summarized by the number of deer harvested per hunter and the number of hunters per square mile. This approach was taken because comparing total harvest or hunter numbers is not always a fair comparison since GMUs vary in size. For example, the average total number of deer harvested over the past five years during the general season in GMUs 149 (Prescott) and 154 (Blue Creek) has been 696 and 317 deer, respectively. Just looking at total harvest suggests deer densities are much higher in GMU 149 than 154. However, when harvest is expressed as deer harvested/mi$^2$, the result is an estimate of 0.49 in GMU 149 and 1.47 in GMU 154, which suggests deer densities are probably much higher in GMU 154 than they are in GMU 149. This is further complicated by the amount of actual deer habitat in each GMU. For example, GMU 149 is the largest GMU, but is comprised primarily of tilled croplands, and deer are concentrated in CRP fields and along the breaks of the Snake River, so densities in a portion of the GMU are probably higher than the harvest/mi$^2$ indicates.

Each GMU was ranked from one to 12 (except for ties) for deer harvested/mi$^2$, hunters/mi$^2$, hunter success rates, and public land access. The ranking values were then summed (public land access excluded) to produce a final rank sum. GMUs are listed by GMU number, not by rank. Comparisons are straightforward because bag limits and seasons are the same for most GMUs. Differences that should be considered include:
Some private land GMUs have extensive acreage in WDFW Access programs, such as Feel Free to Hunt, Hunt by Written Permission, Hunt by Registration, or Hunt by Reservation, and may offer similar access to some GMUs with public land. See the Access section of this document for private land acreage available for public hunting in each GMU.

Some private land GMUs have extensive acreage in tilled croplands, and actual suitable hunting area may be much smaller, leading to higher than expected hunter densities.

</table>
Table 3. Rank sum analysis that provides a quick and general comparison of how total general harvest, hunter numbers, hunter success rates, and access to public land compare among GMUs during general modern, archery, and muzzleloader deer seasons. GMUs in **bold type** are open during early and late seasons for the respective weapon type. Data presented are based on a five-year average (2014-2018).

**WHAT TO EXPECT DURING THE 2019 SEASON**

Wildfires are always a possibility that may affect hunter access to some hunting areas. Hunters should check the status of wildfires and access restrictions [online]. In addition, USFS and WDFW have been conducting prescribed burns and forest thinning projects to reduce wildfire risk. Check with the local USFS offices and WDFW district offices for current status on forest treatment projects.

It is typically uncommon for deer populations to fluctuate dramatically from year to year, especially in District 3 where deer move out of the mountains in winter and weather conditions are generally mild and do not result in large winter die-offs. However, we had very late and heavy snow cover across the district during the winter of 2018/2019, with snow cover persisting well into the usual spring green-up period. Although the deer went through January in presumably good condition, we observed significant winter-kill across the district, with many ranchers along the Snake and Grande Ronde rivers reporting emaciated and dying deer. A substantial number of the dead deer investigated were yearlings, so although we may see an average harvest this year, deer herds are still recovering from the effects of the harsh winter in
2016/2017, and the effects of this winter are expected to carry-over into the 2020 hunting season, due to poor yearling survival and recruitment.

Periodic die-offs have occurred due to epizootic hemorrhagic disease (EHD) and bluetongue, both viral conditions transmitted by a biting midge, which mainly affect white-tailed deer. However, WDFW only received a few reports of deer dying during the summer, particularly in portions of GMU 149 and 154, but have not had a significant outbreak since 2015. We may see some slight effects of last year’s small outbreak in the western portion of the District.

While disease outbreaks are monitored annually, there is nothing feasible to be done to prevent outbreaks of hemorrhagic diseases.

Mule deer populations have experienced long-term declines across much of the west with no definitive cause identified. Habitat loss is suspected to be one possible cause, particularly loss of winter range. The Conservation Reserve Program (CRP) has probably helped maintain winter range in District 3, and mule deer populations outside of the mountains appear to be stable to increasing. However, decreases in available CRP contracts over the last few years have resulted in more land going into agricultural production and will likely have long-term negative impacts on mule deer populations in the district.

The only references WDFW currently has for future potential harvest during general seasons are recent trends in harvest, hunter numbers, and hunter success. Figure 3 provides trend data for each of these statistics by GMU and are intended to provide hunters with the best information possible to make an informed decision on where they want to hunt in District 3 and what they can expect to encounter with regard to hunter success and hunter numbers.
**DEER AREAS**

There are five deer areas in District 3 that were created for a number of purposes. Deer Area 1010 is located within the private land area of GMU 162 and was created to help manage deer damage while limiting antlerless harvest on public land in the GMU. Deer Areas 1008 and 1009 divide GMU 169 and help to manage deer by distributing harvest opportunity across the wilderness area. Deer Area 1021 is located in and around the town of Clarkston in GMU 178 and is used to help manage deer in and around the urban area. Deer Area 1040 is located in GMU 172 and consists of the newly purchased 4-0 Ranch Wildlife Area. Deer and elk hunting in this
area is by permit only, which helps maintain some quality opportunity in the GMU, and also helps keep deer and elk on the wildlife area to limit crop damage on private lands.

**NOTABLE HUNTING ALERTS**

1. New Deer Area 1040 (4-0 Ranch Wildlife Area) is closed to general season deer and elk hunting. Deer and elk hunting is only allowed by 1040 Deer or Elk Area permit holders.

2. Added muzzleloader opportunity in Blue Creek GMU 154 and Marengo GMU 163 with Buck Deer permit hunts and in Deer Area 1010, Marengo, and Peola GMU 178 with Antlerless Deer permit hunts.

3. Added Any Deer permits for youth in selected GMUs.

4. Senior, and Disabled permits: Added GMU 181 to Blue Mountains Foothills GMUs available to hunt.

**BLACK BEAR**

**GENERAL INFORMATION, MANAGEMENT GOALS, AND POPULATION STATUS**

Black bears occur mainly in the foothills and forested areas of District 3, but population densities vary among GMUs. The highest densities of bears occur in GMUs 154 (Blue Creek) and 162 (Dayton).

District 3 consists of GMUs that are part of the Blue Mountains Black Bear Management Unit 8 (BBMU 8), which is one of nine BBMUs defined by WDFW. Currently, allowing for a general bear season during the fall and controlled permit numbers during the spring has maintained harvest metrics within parameters identified by WDFW as reflective of a healthy bear population. The metrics used to direct black bear harvest include the proportion of harvested female bears (no more than 35-39 percent of harvest), the median age of harvested females (range no younger than 5-6 years), and the median age of harvested males (range no younger than 2-4 years).

WDFW does not conduct surveys to monitor trends in black bear population size. Instead, we use trends in harvest data as surrogates to formal population estimates or indices. Currently, black bear populations are believed to be stable in District 3. Because we use age of harvest as a management metric, we want to remind hunters that it is required that a premolar tooth be submitted. Tooth envelopes can be obtained by calling a regional office or stopping in at one of the district offices (best to call ahead as these offices aren’t always staffed full-time), which may be available to help with tooth extraction as well.

**WHAT TO EXPECT DURING THE 2019 SEASON**

Although there are hunters who specifically target black bears, most bears are harvested opportunistically during general deer and elk seasons. Consequently, annual harvest can vary quite a bit from one year to the next and overall hunter success is quite low. Since 2001, hunter success in District 3 has averaged just 6 percent and has never been higher than 9 percent.
However, hunter success is likely higher for those hunters who specifically hunt bears versus those who buy a bear tag in case they see one while they are deer or elk hunting.

Overall, there has been no trend in annual bear harvest during the general bear season in District 3, with harvest generally fluctuating between 75 and 100 bears, excluding a few outliers. 2011 was a relatively poor year, with 66 bears harvested, but harvest rebounded during the 2012 and 2013 seasons before dropping off again in 2014 to 62 bears (Figure 8). With annual fluctuations in hunter numbers, some index of harvest per unit effort is generally a better indicator of harvest trends. Figure 4 shows the number of hunter days per bear harvested, which also does not show any consistent trend.

At the GMU level, most bears will be harvested in GMUs 154 (Blue Creek) and 162 (Dayton) (Figure 5). Harvest numbers during the 2010, 2014, and 2017 seasons compared to long-term (10-year) and short-term (5-year) averages were lower in both GMUs 154 and 162, but the yearly District harvest does not show any identifiable trends (Figure 4) other than there have been very few low harvest years back-to-back. This was again highlighted by the rebound in both the 2015 and 2016 harvests after the low 2014 harvest and again in 2018 after the low 2017 harvest. Based on general long-term stability in District 3 bear harvest, hunters should expect similar harvest and success rates during the 2019 season.

![Figure 4. Trends in the number of male and female black bears and total number of bears harvested during the general bear season, and an index of hunter effort (hunter days/bear harvested) in District 3, 2009–2018 (the sex of harvested bears is not available for 2011).]
HOW TO LOCATE AND HARVEST A BLACK BEAR

Scouting is an important factor that hunters should consider when specifically hunting for black bears in District 3. Although black bears are extremely common and occur in some areas at very high densities, they are seen infrequently because they generally limit their time in the open to cooler times of day and move into thick vegetation in draws and creek bottoms.

Black bears can occur in a variety of habitat types so it can be difficult to narrow down where to search for them. Hunters should focus their efforts early and late in the day in more open terrain (e.g. south-facing slopes). In September, bears can spend a considerable amount of time in the lower elevations of the Blue Mountain foothills in search of fruit that has ripened in the riparian areas and around old homesteads.

Bears can often be located along riparian corridors that contain a large number of berry-producing shrubs, including creeping blackberries and elderberries, or along north-facing slopes with salmonberries, huckleberries, and blackberries. Spring permit holders should look below the snow-line on south-facing slopes that get early green-up of wild onions and other vegetation and near springs or wet areas with green aquatic vegetation. During the fall, hunters will generally find bears foraging across open slopes dissected by shrubby draws early in the day. Also, hunters should check riparian areas that may still have berries or rose hips, and hike through them to see if there is any bear sign. If fresh sign is found, odds are there is a bear frequenting that area. If hunters are patient and sit for extended periods of time watching open areas in these riparian patches and corridors, they may get a chance to harvest a bear. Patience is the key.

NOTABLE HUNTING ALERTS

The 2019 hunting season in District 3 has been extended from August 1 to November 15 to conform to new statewide standard opening and closing dates. In addition, the 2-bear harvest limit has been extended statewide. Hunters are still only allowed one bear on their spring bear permit but can harvest an additional bear during the fall season or 2 bears in the fall if they were unsuccessful on their spring permit hunt or did not draw a spring permit.
Cougars occur throughout District 3, but densities likely vary among GMUs. Cougar populations in District 3 are managed with the primary objective of maintaining stable adult territories and population by limiting harvest of adult cougars to approximately 12 percent of the cougar population. Beginning in 2012, WDFW has continually adjusted the way it manages cougar harvest in Washington. The biggest change was shifting away from using season length or permit seasons to manage the number of cougar harvested, and instead using a standard liberal season coupled with harvest guidelines. The intent was to have a longer season, without any weapon restrictions, and only close cougar seasons in specific areas if harvest reached or exceeded a harvest guideline.

To accomplish harvest goals, WDFW established a series of hunt areas, each with its own harvest guidelines and with standard season dates of Sept. 1 through April 30. Harvest guidelines do not affect cougar hunting seasons until harvest numbers are evaluated starting January 1. At that point, any hunt area that meets or exceeds the harvest guideline may be closed, depending on the age and sex composition of the harvest. If hunters plan on hunting cougar after January 1, they must confirm that the cougar season is open in the area they plan to hunt. Harvest guidelines for each hunt area located in District 3 are provided in Table 4.
For more information related to the new harvest guidelines management approach, please visit WDFW’s website.

Table 4. Harvest guidelines and 2018 harvest for the three cougar hunt areas located in District 3.

**WHAT TO EXPECT DURING THE 2019 SEASON**

Cougar harvest in District 3 has been variable over the years, with the average since 1990 of 16 cougars and a range between a low of seven and a high of 33. However, in 17 out of the last 25 years, the range has been between 12 and 20 cougars harvested. Since 2001, the number of cougars harvested in District 3 has averaged 14 cougars, and sub-adults typically dominate the harvest. With the yearly variation, it is hard to predict future harvest, but cougar sightings in the District continue to be fairly common and there is no reason to suspect much change in the harvest. Under the continuing harvest management guidelines, all hunt areas are likely to close by the January 1 evaluation period, so hunters interested in cougar hunting in any of these GMUs need to plan accordingly.
Figure 6. The estimated number of cougars harvested in District 3, 2009–2018. The dashed line represents the upper harvest guideline for all three cougar areas combined.

NOTABLE HUNTING ALERTS
1. The late season extends from between January 1 to April 30, 2019. **Be aware that 2019 licenses expire at the end of March, and a 2020 cougar license is required to hunt cougar after March 31.**

**DUCKS**

**COMMON SPECIES**

A wide variety of ducks occur in District 3. Common dabbling ducks include mallard, northern pintail, American widgeon, green-wing teal, and northern shoveler. Species of divers, including bufflehead, scaup, canvasback, and common goldeneye are present along the reservoirs of the Snake and Columbia rivers and can occur in fairly large numbers.

Mallards are the most abundant duck species in Washington and constitute the vast majority of ducks harvested statewide (typically about 50 percent). Mid-winter surveys in the South Columbia Basin segment of District 3 typically yield more than 50 percent of mallards in the
dabbling duck count, with goldeneye and canvasback making up 80 percent of the diving ducks. Hunters should expect harvest opportunities to be mostly mallard and American widgeon, although hunting by boat in the river reservoirs can yield good harvests of diving ducks.

**MIGRATION CHRONOLOGY**

There are very few ducks in District 3 during late-spring and early summer. Beginning in mid to late September, birds will begin migrating south from British Columbia, the Yukon, and Alaska, and numbers will continue to increase until they peak in late October and early November. Although migration patterns have not been intensively studied, it is believed ducks use concentration areas in District 3 as resting and foraging areas and do not stay in the district for long periods of time. Consequently, the number of ducks located in District 3 most likely changes on a daily basis, but begins to decline sharply when there are no more new migrants coming into the area from breeding grounds to the north.

**CONCENTRATION AREAS**

In general, concentration areas include the wetlands and rivers around McNary National Wildlife Refuge (NWR) and the Columbia and Snake River valleys. Concentrations within these broader areas are dependent on many factors (e.g. hunting pressure, weather, food, etc.), and have the potential to change on a daily basis. The agricultural areas around McNary NWR attract large numbers of foraging ducks and geese, but most of these lands are closed to hunting or leased by private hunting outfitters and access can be difficult or expensive.

**POPULATION STATUS**

The number of ducks in District 3 during established hunting seasons is most strongly related to the status of breeding duck populations in Alaska and Canada. The following are the trends over the last five years: the 2014 breeding survey estimated the breeding population in Alaska at 3.5 million ducks, a 6 percent increase over 2013 values, but still well below the 2012 estimate of 4.4 million. The mallard estimate recovered from 2013 lows of 338,000 to an estimate of 501,000 for 2014, a 48 percent increase and similar to the 2012 estimate (USFWS, Trends in Duck Breeding Populations, 1955-2015). In 2015, the total estimate for the Alaska-Yukon Territory-Old Crow Flats traditional survey area was 3.4 million, a 3 percent decrease from 2014 estimates and 8 percent below the long-term average. The mallard breeding population estimate was 471,000, a decrease of 6 percent from 2014 levels, but still 24 percent above the long-term average. In 2016, the total estimate for the Alaska-Yukon Territory-Old Crow Flats area was 4.3 million, a 28 percent increase over 2015 estimates and 17 percent above the long-term trends. The mallard breeding population estimate was 584,000, 24 percent above the 2015 estimates and 54 percent above the long-term trend. In 2017, the total estimate for the AK-Yukon area was 3.99 million, an 8 percent decline from the previous year, but 8 percent higher than the long-term average. The 2017 estimate for mallards was 538,000, an 8 percent decline from the 2016 estimate but 40 percent above the long-term average. In 2018, the total estimate for the AK-Yukon area was 3.38 million, 15 percent below 2017 estimates and 9 percent below the long-term average. The 2018 harvest in District 3 mirrored the population estimates, with a 15 percent decline in harvest over the 2017 duck harvest. In 2018, the mallard population estimate was 451,000, a 16 percent decline over 2017 estimates but still 17 percent above the long-term average.
HARVEST TRENDS AND 2019 PROSPECTS

The 2018 duck harvest, down 15 percent overall from 2017, marks the third year in a row of decreased harvest, mirroring decreased breeding estimates for two out of the last three years from the breeding grounds in Alaska and Canada. The 2018 harvest was also 15 percent below the five-year average. The district saw the largest decreases in Asotin and Walla Walla counties, with Columbia and Garfield counties showing average harvest; however, overall harvest declines were partially due to lower hunter effort, although the average harvest/day was also lower in 2018. Generally, the waterfowl breeding surveys track well with hunter success. Although hunter numbers have remained relatively stable, the number of hunter days has declined in three out of the last five years and 2018 hunter days were well below both the five- and 10-year averages (Figure 8). The 2019 Waterfowl Population Status Report was not available at the time of this writing, but hunters should check the report at the USFWS page for insight into the 2019 population estimates for waterfowl hunting prospects.

Figure 7. Trends in the total number of ducks harvested (blue line, right axis), and totals by county in Walla Walla (purple line, right axis), Asotin, Columbia, and Garfield counties (bars, left axis), 2009–2018.
**HUNTING TECHNIQUES**

How hunters go about hunting ducks is largely dependent on where they choose to hunt. When hunting inland waters associated with ponds and rivers, or feeding areas, traditional decoy setups work the best. Birds are most active during early morning and late afternoon as they move from resting areas to feeding areas. See the WDFW waterfowl page for more information on hunting ducks.

**PUBLIC LAND OPPORTUNITIES**

There are a number of U.S. Army Corp of Engineer (USACE) Habitat Management Units along the Snake River in District 3 that offer good waterfowl hunting opportunities, and McNary NWR along the Columbia River offers some of the premier hunting opportunities in the district. WDFW Wildlife Areas in District 3 are primarily big game habitat and do not offer much waterfowl hunting opportunity, but hunters should see the WDFW waterfowl hunting page for more detailed information related to their location, current waterfowl management activities, and common species.
COMMON SPECIES

Canada geese are the only goose species available for harvest in District 3 during the early September season, while Canada, snow, Ross, and white-fronted geese may all be taken during the late season.

MIGRATION CHRONOLOGY AND CONCENTRATION AREAS

The migration chronology of geese in District 3 is nearly identical to that described for ducks, with very few geese occurring in the district until migrants begin showing up from Alaska in September. However, one distinct difference between ducks and geese is goose numbers do not decline as sharply as duck numbers do around the latter half of November. Instead, many geese choose to over-winter in the agricultural areas of the district as long as snow cover does not become excessive.

POPULATION STATUS

There are few geese that breed in District 3, so WDFW does not conduct breeding goose surveys in this part of the state. Urban goose populations can be problematic at times but offer limited hunting opportunities.

HARVEST TRENDS AND 2019 PROSPECTS

Goose hunting opportunities in District 3 are expected to be similar to trends observed during the last few seasons. Most goose harvest will occur in Walla Walla County during the late season, where twice as many geese are harvested each year compared to Asotin, Columbia, and Garfield counties combined. Although harvest is low in the three eastern counties of the district, creative hunters can find opportunities along the Touchet, Tucannon, and Snake rivers by requesting access from farmers who have geese feeding daily in their crop fields, particularly alfalfa.
Figure 9. Trends in the total number of geese harvested (pale blue line), and totals by county in Asotin, Columbia, Garfield, and Walla Walla counties, 2009–2018.

Figure 10. Trends in the total goose hunter days (left axis), and geese harvested per hunter day (right axis) in District 3, 2009–2018.
HUNTING TECHNIQUES

The standard techniques employed to harvest geese include finding agricultural areas where geese are feeding and setting up a decoy spread well before daylight in parts of the fields where geese are expected to concentrate. In District 3, agricultural areas where feeding geese congregate are dryland and irrigated agricultural fields relatively close to the Snake or Columbia rivers. Because of this, goose hunting opportunities most often occur on private property and require hunters to gain permission before hunting. There are multiple guide services available for hunters willing to pay for access and experience.

SPECIAL REGULATIONS

It is strongly recommended that hunters review the most recent Washington State Migratory Waterfowl and Upland Game Seasons pamphlet to ensure they are in compliance, as there are specific daily regulations. Pamphlets are available at any retailer that sells hunting licenses or they can be downloaded from WDFW’s website.

FOREST GROUSE

SPECIES AND GENERAL HABITAT CHARACTERISTICS

There are two species of grouse that occur in District 3 -- ruffed grouse and dusky grouse (formerly called blue grouse). Ruffed grouse are the most abundant grouse in the Blue Mountains, and generally occur at lower elevations and along shrubby draws and riparian areas where hardwoods are present. Dusky grouse can be located in upper elevation timbered slopes and mountain meadows, often near springs or some other water source. Both species will be attracted to berry producing vegetation, such as chokecherry, current, elderberry, and snowberry, with aspen stands also being an attractive habitat for both cover and forage.

POPULATION STATUS

WDFW does not conduct any standardized surveys to monitor grouse populations in District 3. Instead, harvest data trends are used to monitor general population status. Total harvest numbers tend to vary with hunter numbers, so catch-per-unit-effort (CPUE), which tracks birds harvested per hunter day, is the best indicator of population trends. In District 3, grouse populations appeared to be at least stable if not increasing until the 2016 season, as CPUE has slowly increased from a low in 2011 until a drop in 2016. While both harvest numbers and hunter days have been decreasing, the increase in CPUE suggests grouse populations have been stable (Figure 11), but were likely impacted by difficult winters in 2016 and 2018. The correlation between harvest numbers and the number of hunter days is fairly robust, with more days generally equating to more grouse harvested, which also suggests the Blue Mountains grouse population is stable (Figure 12).
Figure 11. Number of grouse harvested, number of hunter days (right axis), and grouse harvested per hunter day (left axis), 2009-2018.

Figure 12. Number of grouse harvested in relation to hunter days, 2006-2018.
HARVEST TRENDS AND 2019 PROSPECTS

The total number of grouse harvested in District 3 has declined significantly since 2009, when 5,147 grouse were estimated to be harvested. This is compared to 2,143 in 2017. However, hunter numbers have declined as well, with a dramatic decrease in 2010 followed by a slow decline since then. Despite the sharp declines in harvest, the strong correlation between hunter days and total grouse harvested suggests hunters should expect on average to harvest one grouse for every two to three days hunting. Typically, a hunter may go a few days without seeing birds or getting a shot at any, but will harvest multiple birds on a given day, once they find good habitat and encounter birds still in family groups.

HUNTING TECHNIQUES AND WHERE TO HUNT

In general, the most effective way to hunt grouse in District 3 is by walking roads and shooting them as they flush or flushing after they roost in a nearby tree. Dusky grouse tend to occur in higher densities in the higher elevations of the Blue Mountains, and can occasionally be found in good numbers along grassy open ridges mixed with conifer forests. Ruffed grouse are closely associated with riparian areas throughout all elevations of the forested portions of the Blue Mountains. To learn more about how to hunt Washington’s grouse species, see WDFW’s upland bird hunting webpage.

PHEASANTS

The best pheasant hunting opportunities in District 3 are associated with the Eastern Washington Pheasant Enhancement Program. Each year, approximately 3,500 pheasants are released in Region 1, and many of these are destined for release sites in District 3. Nine sites are located throughout the district. Four of those sites (Hollebeke HMU, Mill Creek HMU, Rice Bar HMU, and Willow Bar HMU) are owned by the U.S. Army Corps of Engineers, two sites (Asotin WLA and the Hartsock Unit of the Wooten WLA) are WDFW-owned, and the rest are on private lands open to the public under WDFW’s Feel Free to Hunt access program. Releases take place for the youth season on most of the sites in mid-September, and the remaining releases happen sporadically throughout the pheasant hunting season.

SPECIES AND GENERAL HABITAT CHARACTERISTICS

Pheasants are closely associated with agricultural and grassland habitats throughout the northern and western portions of the district. The best pheasant hunting is located in areas of permanent cover, usually associated with riparian or shrubby habitats. There is no question that the district has lost pheasants and pheasant habitat over the past quarter century, due in part to changes in farming practices, increase in invasive weed species, and potentially due to long-term changes in precipitation across the region. However, the district still offers many good hunting opportunities for both wild and planted birds.

POPULATION STATUS

WDFW does not currently generate population estimates for pheasants. Instead, harvest data trends are used to monitor general population status. Total harvest numbers tend to vary with hunter numbers, so catch-per-unit-effort (CPUE), which track birds harvested per hunter day, is
the best indicator of population trends. In District 3, pheasant CPUE has remained relatively stable over the past decade. CPUE in 2018 was 0.73 birds harvested per hunter day, with the previous five-year average being 0.69. Other WDFW information implies that populations have declined during the past few decades, but appear to have recently stabilized. For the period from 2006-2018, there is a strong correlation between the number of pheasants harvested and the number of hunter days, which also suggests a stable population over the same time period.

Figure 13. Total pheasant harvest, hunter days, and harvest per day in District 3, 2009-2018.
HARVEST TRENDS AND 2019 PROSPECTS

The total number of pheasants harvested in District 3 is dependent upon habitat and weather conditions during the breeding season. Spring of 2019 was probably fairly hard on gamebirds, as snow persisted in many areas through March, and temperatures continued to be cool with moderately wet weather through the nesting season. Temperatures moderated during the hatching period and have been generally favorable through the fledgling period, so although adult numbers may be down, there should be a good production of young of the year birds.

HUNTING TECHNIQUES AND WHERE TO HUNT

In general, the most effective way to hunt pheasants in District 3 is with the use of a bird dog. Pheasants are usually located in thicker cover and often require a dog to flush them if they do not run in front of hunters. To learn more about how to hunt Washington’s pheasants, please visit WDFW’s upland bird hunting webpage.

Hunters should be aware that special regulations apply when hunting on eastern Washington pheasant release sites. Most notably, hunters are required to use nontoxic shot. To locate maps for the Mill Creek, Hollebeke, Rice Bar, and Willow Bar HMUs, as well as the Asotin and Hartsock WMA release sites, and to learn more about the Eastern Washington Pheasant Enhancement Program, visit the WDFW website.
QUAIL

SPECIES AND GENERAL HABITAT CHARACTERISTICS

California quail are common in the lower elevation draws and drainages across the foothills of the Blue Mountains, and in suitable pockets of habitat across the prairie areas and breaks of the Grande Ronde and Snake rivers. Mountain quail occur in District 3, but there are no sizable populations and sightings are uncommon. When they do occur, it is usually along the Asotin Creek drainage and tributaries that have abundant shrub cover, and hunters looking for California quail in this area should be careful to identify their target, as mountain quail are protected in eastern Washington.

POPULATION STATUS

WDFW does not estimate population size for quail. Instead, harvest data trends are used to monitor population status. Total harvest numbers tend to vary with hunter numbers, so catch-per-unit-effort (CPUE), which tracks birds harvested per hunter day is the best indicator of population trends. In District 3, recent quail CPUE has improved significantly from low levels in 2013, likely due to weather during the nesting period. CPUE in 2014 was 1.23 birds harvested per hunter day and remained stable through the 2016 season at 1.38 birds harvested per hunter day, but dropped drastically in 2017 to 0.64 birds/hunter day, with the previous five-year average being 1.14 birds/day. An expected improvement in quail harvest did not materialize in 2018, with another low harvest of only 0.62 birds/hunter day. Conditions this year have not been as favorable as last, so there may be another low harvest in 2019.

HARVEST TRENDS AND 2019 PROSPECTS

The total number of quail harvested in District 3 is dependent upon habitat and weather conditions during the breeding season. The breeding conditions during spring and early summer of 2019 have been poor, but improved over the summer and may have a positive effect on brood rearing for quail. Biologists predict that quail harvest numbers will continue their recent slide, and hope for a rebound during the 2020 season.

HUNTING TECHNIQUES AND WHERE TO HUNT

In general, the most effective way to hunt quail in District 3 is with the use of a bird dog. Quail are usually located in thicker cover and often require a dog to flush. To learn more about how to hunt Washington’s quail, please visit WDFW’s upland bird hunting webpage.

TURKEYS

Wild turkeys of the Rio Grande subspecies have been introduced into southeast Washington and have become very common. Turkeys are found in the lower elevation draws and drainages across the foothills of the Blue Mountains, and in suitable pockets of habitat across the prairie areas and breaks of the Grande Ronde and Snake rivers. Turkeys can be found in all GMUs but tend to be concentrated along riparian areas in the lower elevations of the Blue Mountains and often near farmsteads and towns.
Figure 15. Map depicting WDFW’s seven wild turkey population management units.

**POPULATION STATUS**

WDFW does not estimate population size for turkeys. Instead, harvest data trends are used to monitor population status. Total harvest numbers tend to vary with hunter numbers so catch-per-unit-effort (CPUE), which tracks birds harvested per hunter day, is the best indicator of population trends. In District 3, turkey CPUE rebounded from a below average year in 2013 to a CPUE of 0.10 in 2014, 0.09 in 2015, and 0.11 in 2016, similar to the previous five-year average of 0.10 turkeys per hunter day. 2017 was another below average year, with CPUE of 0.077, likely attributed to turkeys experiencing high winter mortality. The fall season was much better with a CPUE of 0.12 birds/hunter day, indicating good brood survival over the spring and summer. The 2018 harvest continued the improving trend, with a CPUE of 0.096 during the spring season, and 0.11 for the fall.
HARVEST TRENDS AND 2019 PROSPECTS

The total number of turkeys harvested in District 3 is dependent upon habitat and weather conditions during the breeding season. Total harvest dropped from 824 turkeys in 2012 to 638 in 2013, and rebounded slightly to 742 harvested in 2014, 770 harvest in 2015, 773 harvest in 2016, 769 in 2017, to 1,053 in 2018, which is well above the five-year average of 738 birds. Most of the increase was due to high fall harvest, probably due to the new regulations increasing the bag limit to four turkeys during the fall season. The spring season limit remains at 2 bearded turkeys in Eastern WA. Based on long-term harvest trends, turkey populations in southeast Washington appear to have stabilized after years of increasing harvest, and future harvest is likely to be most impacted by spring weather conditions on brood survival and the occasional hard winter impacting adult birds. The spring and early summer of 2019 have had fair conditions for nesting and brood rearing for turkeys. Biologists predict that turkey numbers should continue to be robust through the fall of 2019.

HUNTING TECHNIQUES AND WHERE TO HUNT

Most turkey hunters target gobblers in the spring when males are displaying and readily come to box, slate, and mouth calls that mimic hen groups. Setting a blind or using camouflage clothing near meadows or small forest openings used as strutting grounds can be very effective. Often only minimal calling is needed to bring turkeys within range. Identifying roost areas and setting up nearby can also be effective, but efficient calling will be needed to attract birds. Gobble calls should only be used infrequently, and hunters generally should not stalk or approach gobble calls, as it may be another hunter.
GMUs 154 (Blue Creek) and 162 (Dayton) have the highest turkey harvests. The highest densities are often found on private land in the lower foothill areas that have a mix of forest, grassland, and agricultural fields, and flocks can frequently be seen from roadways along the creek drainages in these areas. Some of these flocks have become nuisance birds, and landowners are often willing to grant permission to thin turkey numbers. Be respectful of private land and always ask for permission to hunt. Although densities are lower, good numbers of birds can be found on National Forest lands and local wildlife areas, including the Wooten Wildlife Area in GMU 166 (Tucannon), Asotin Creek Wildlife Area in GMU 175 (Lick Creek), and the Chief Joseph Wildlife Area in GMU 186 (Grande Ronde). Don’t overlook the hidden gem of the George Creek Unit (GMU 181) of the Asotin Wildlife Area.

OTHER SMALL GAME SPECIES

Other small game species and furbearers that occur in District 3 but were not covered in detail include cottontail rabbits, snowshoe hares, coyotes, beaver, raccoons, river otter, marten, mink, muskrat, and weasels. Additional game birds with significant harvests in District 3 include chukar and gray partridge, and migratory birds including mourning doves, snipe, and coot. Asotin County accounts for the majority of the chukar and gray partridge harvest, with Columbia and Garfield counties having localized pockets of good hunting for these species. Walla Walla County accounts for the majority of the mourning dove harvest, and the introduced Eurasian collared dove, which can be hunted anytime with a small game license, has become common in the developed areas of all four counties.

MAJOR PUBLIC LANDS

District 3 does offer considerable public land and Feel Free to Hunt access opportunities. Public land opportunities within the district are comprised of U.S. Forest Service (Umatilla National Forest), U.S. Army Corps of Engineers, WA Department of Natural Resources, Bureau of Land Management, and WDFW, while the Rainwater Wildlife Area of the Confederated Tribes of the Umatilla Indian Reservation is in the Feel Free to Hunt Access Program.

GMUs with the greatest amount of public land include GMU 157 (Mill Creek Watershed, closed to entry except by permit), GMU 162 (Dayton), GMU 166 (Tucannon), GMU 169 (Wenaha), GMU 172 (Mountain View), GMU 175 (Lick Creek), GMU 181 (Couse), and GMU 186 (Grande Ronde).

For more information related to the location of WDFW wildlife areas and other public land, visit WDFW’s hunting regulations webmap.

GENERAL OVERVIEW OF HUNTER ACCESS IN EACH GMU

One of the most common questions from hunters is, “What is hunter access like in particular GMUs?” Generally, this question is referring to the amount of public land in each GMU, and the following ratings reflect that assumption. Please refer to the Private Land Access Program section of this document to determine which GMUs have significant amounts of additional lands available for public hunting.
The following rating system was developed for District 3 GMUs to give hunters a general idea of what type of access is available in the GMU they want to hunt. For the purposes of this exercise, access ratings are specific to the level of public land available. Each GMU was given a rating of excellent, good, or poor, with the level of access associated with each rating as follows:

- **Excellent** – A majority of the GMU is in public ownership.
- **Good** – There is a mix of public land within the GMU.
- **Poor** – Most of the GMU is privately owned.

Information provided is a brief description of major ownership. Hunters are encouraged to contact the WDFW Eastern Region (Region 1) office in Spokane Valley (509-892-1001) with other questions related to hunter access.

**GMU 145 - MAYVIEW**

Access rating – Poor

The majority of this GMU is in private ownership, although the U.S. Army Corps of Engineers (USACE) owns the shorelines of the Snake River. In many places, the USACE lands only extend a couple of hundred yards above the waterlines, but there are a few large habitat management units that provide considerable recreational opportunity. There is significant acreage from this unit enrolled in WDFW’s Access Program.

**GMU 149 – PRESCOTT**

Access rating – Poor

The majority of this GMU is in private ownership, although USACE owns the shorelines of the Snake River. In many places, the USACE lands only extend a couple of hundred yards above the waterlines, but there are a few large habitat management units that provide considerable recreational opportunity. There is significant acreage from this unit enrolled WDFW’s Access Program, and the Tucannon Wind Resource area managed by Portland General Electric has limited hunting (see GMU 163 for information and links).

**GMU 154 – BLUE CREEK**

Access Rating – Poor/good

The majority of this GMU is in private ownership, although a number of large landowners participate in the department’s private land access program. Hunters wishing to hunt in this GMU are highly encouraged to contact landowners long before their season opens to secure access. Hunters applying for special permits in this GMU are encouraged to secure access prior to applying.

**GMU 157 – MILL CREEK WATERSHED**

Access rating – No entry without permit
Although this GMU is 99 percent public lands, access is restricted to special permit holders. The Mill Creek Watershed has regulated public access because it is the source of drinking water for the City of Walla Walla. Currently, there are only elk permit opportunities within this GMU.

**GMU 162 - DAYTON**

Access rating – Good/poor

Approximately half of this GMU is in public ownership, primarily USFS and Confederated Tribes of the Umatilla Indian Reservation. Private land access can be difficult to obtain within this GMU, although a few landowners participate in the department’s private land access program.

**GMU 163 - MARENGO**

Access rating – Poor

A majority of this GMU is in private ownership. This GMU has a large percentage of the land developed for wind power. Special rules are in place to ensure the safety of hunters, local residents, wind project workers, and equipment. More information is available through the wind project [hunting video](#). Remember, hunting on private lands is a privilege and, as with all hunting activities, rules and prohibitions are enforced by state game agents and local law enforcement. Access to PacifiCorp’s Marengo wind facility, Puget Sound Energy’s adjacent Hopkins Ridge wind facility, and Portland General Electric's Tucannon River wind farm is jointly administered by the utilities. With this shared access program, hunters only need to register with one utility to hunt at any of these wind facilities.

Written permission for access to these lands may be obtained by completing the online registration form. Forms are also available at:

**GMU 166 - TUCANNON**

Access rating – Excellent

A majority of this GMU is owned by WDFW and USFS. Access is good throughout most of the unit, with a portion of the unit being located within the Wenaha-Tucannon Wilderness.

**GMU 169 - WENAHA**

Access rating = Excellent
This GMU is 100 percent public lands, with 95 percent of it located within the Wenaha-Tucannon Wilderness. This is a very rugged wilderness topographically and access can be physically challenging.

**GMU 172 – MOUNTAIN VIEW**

Access rating – Good

Approximately 50 percent of this GMU is in public ownership. Access to the private lands can be difficult to obtain. This GMU also has the 4-0 Ranch Wildlife Area located within it, where deer and elk hunting is permitted by special draw only.

**GMU 175 – LICK CREEK**

Access rating – Excellent

A majority of this GMU is in public ownership, administered by the USFS, WDFW, and DNR. Access is excellent and this GMU has the highest road density of any of the District 3 GMUs.

**GMU 178 - PEOLA**

Access rating – Poor

This GMU is predominantly private land, with the public land (DNR sections) often being land locked from public access. Landowners tend to allow significant access throughout the GMU and there are numerous landowners who participate in WDFW private lands access program.

**GMU 181 - COUSE**

Access rating – Good/poor

This GMU is mostly private land, but WDFW does own a considerable amount of land. See the WDFW wildlife area webpage.

**GMU 186 – GRANDE RONDE**

Access rating – Good/poor

Approximately half of this GMU is in public ownership. Access to the private land in this GMU has not been available to the public in recent years.

---

**PRIVATE LANDS ACCESS PROGRAM**

There are a multitude of private landowners in District 3 who are enrolled in WDFW’s Private Lands Access Program. However, at the time of this writing, cooperative agreements with some of these landowners have not been finalized. Hunters are encouraged to call the WDFW Eastern Region (Region 1) office in Spokane Valley (509-892-1001) or periodically check for updated information in this document or on WDFW’s [Hunter Access website](http://www.wdfw.wa.gov).
The following is a summary of anticipated private land acres available through the department’s Private Lands Access program in 2019.

### ONLINE TOOLS AND MAPS

Most GMUs in District 3 are a checkerboard of ownerships and sometimes it can be extremely difficult to determine who owns the land where a hunter wishes to hunt. However, there are several online tools and resources many hunters do not know about that provide valuable information that helps solve the landowner puzzle. The following is a list and general description of tools and resources available to the general public.

**DEPARTMENT OF NATURAL RESOURCES PUBLIC LANDS QUADRANGLE (PLQ) MAPS**

The best source for identifying the specific location of public lands is DNR PLQ maps, which can be purchased for less than $10 on DNR’s website.
ONLINE PARCEL DATABASES

Technology has come a long way and has made it much easier for the general public to identify tax parcel boundaries and the associated landowner. However, because this technology has not been readily available in the past, there are several hunters who are not aware it exists.

Walla Walla County tax parcels can be searched using the county GIS site, which is a user-friendly mapping program that allows users to zoom in to their area of interest, click on a parcel, and identify who the owner of that parcel is. The Walla Walla County GIS tool can be accessed online.

WDFW’S MAPPING TOOL

WDFW’s GoHunt tool has been revamped as the new Hunt Regulations Webmap and provides hunters with a great interactive tool for locating tracts of public land within each GMU. The webmap can be accessed by clicking the above link or going to WDFW’s hunting website.
